### COVER PHOTO

Bruce Bathols VK3UV, the Editor of AR, is sometimes able to find time to operate on the amateur bands. Bruce is a relative newcomer to amateur radio, being first licensed in November 1971. He has been a member of the Publications Committee since early 1972. The antenna system is a 4-element monoband Yagi on 20 metres (inset), and a homebrew multi-band dipole system for the other HF bands.

**HAM**

# RADIO SUPPLIERS

323 ELIZABETH STREET, MELBOURNE, VIC., 3000

Phones: 67-7329, 67-4286

Our Disposals Store at 104 HIGHETT ST., RICHMOND (Phone 42-8136) is open Mondays to Fridays, 9.00 a.m. to 5.00 p.m., and on Saturdays to midday.

**MODEL QL54 D/P MULTIMETER.** Very ruggedly constructed, this model is particularly suitable for workshops. It features special scales for measurement of capacitance and inductance. Diode protected movement. Specifications: 20,000 ohm/volt DC. 8,000 ohm/volt AC. DC Volts — 0.25; 1; 2.5V; 10; 50; 250; 1,000; 5,000. AC Volts — 10; 50; 250; 1,000; 5,000. DC Current — 0.1mA; 1mA; 10mA; 50mA; 500mA; 10A. Ohms — 4K ohm. 40K ohm. 4M ohm. 40M ohm. Centre Scale: 40 ohm. 4,000 ohm; 40,000 ohm; 400,000 ohm. Decibel: -20 to +62 dB. Dimensions: 8" x 4-1/2" x 2"; 152 x 107 x 51 mm. Inductance — 0/5000H. Carrying case available. Model C \$6.90.

\$32.50 — Postage \$2.20

## E.E.I. PORTABLE RADIO AM/AIR VHF

## SPECIFICATIONS:

Freq. Range: AM530-1600 kHz, AIR (VHF) 108-174 MHz. Intermed. Freq.: AM 465 kHz, FM 10.7 MHz. Output: 450 mW max. Speaker: 2½" permanent magnet dynamic. Antenna: 1/2 wave dipole or omnidirectional whip. Power Source: DC 9V (4 x UM3 Penlite) or equivalent. Semiconductor: 10 trans., 7 diodes. Dimensions: 8½" (W) x 4½" (H) x 1-7/8" (D)

\$18.90 — Postage \$1.40

## MODEL AB190 D/P MULTIMETER

This meter features double zener diode meter protection and 3½" full view easy to read scale. Features built-in polarity reversing switch and housed in a strong moulded case with carrying handle.

SPECIFICATION: 1000,000 ohm/volt DC. 10,000 ohm/volt AC. DC Volts: 0.3, 3, 12, 60, 120, 300, 600, 1,200. AC Volts: 0, 30, 120, 300, 600, 1,200. DC Current: 12 uA. 1mA. 10mA. 50mA. 500mA. 1A. Ohms: 200K, 20K, 200K, 20K ohm. Centre Scale: 20 ohm, 2,000 ohm, 20,000 ohm, 200,000 ohm, 20M ohm. Decibel: -20 to +57 dB. Dimensions: 7-3/8" x 5-2/5" x 2-3/5" ins. Carrying case for model I — \$7.90.

Price: \$62.50 — Postage \$2.20.

## MODEL NC-310 DE LUXE 1 WATT 3 CHANNEL C.B. TRANSCEIVER

- WITH CALL SYSTEM
- EXTERNAL AERIAL CONNECTION

## SPECIFICATIONS, NC-310

Transistors: 13. Channel Number: 3, 27.24 MHz. Citz. Band. Transmitter Frequency Tolerance: ± 0.005%. RF Input Power: 1 Watt. Tone Call Frequency: 2000 Hz. Receiver type: Superheterodyne. Receiver Sensitivity: 0.7 uV at 10 dB S/N. Selectivity: 45 dB at ± 10 kHz. IF Frequency: 455 kHz. Audio Output: 500 mW to External Speaker Jack. Power Supply: 8 UM-3 (penlite battery). Current Drain: Transmitter: 120-220 mA. Receiver: 20-130 mA. Price: \$105.00 — Postage \$1.40

**MAIL ORDERS WELCOMED.** Please allow pack and post on items listed on this page. If further information required send a stamped SAE for immediate reply from the above address. Larger items can be sent F.O.B. Due to circumstances beyond our control, prices quoted in this advertisement are subject to alteration without notice. New equipment available at our Bridge Road Store.

## YAESU FRG-7

THE RADIO FOR WORLD-WIDE LISTENING AT ITS BEST — 0.5-29.9 MHz COVERAGE SYNTHESIZED COMMUNICATION RECEIVER

The model FRG-7 is a precision built high performance communication receiver designed to cover the band from 0.5-29.9 MHz. Its state of the art technology offers an unprecedented level of versatility. The Wadley Loop System (drift cancellation circuit) coupled with a triple conversion super heterodyne system guarantees an extremely high sensitivity and excellent stability. It provides complete satisfaction to amateurs as well as BCBs with superb performance and many features such as RF attenuator, selectable tone, and automatic noise suppression circuit.

\$328

## SOLID STATE 19 TRANSISTOR MULTI-BAND RADIO — 9 RANGES

FREQ. RANGE: AM 535-1605 kHz. MB1 1.6-2.4 MHz. MB2 2.8-4.1 MHz. SW1 4-6 MHz. SW2 7-12 MHz. FM 88-108 MHz. VHF 108-136 MHz. VHF2 140-175 MHz. VHF3 162-174 MHz. LF. POWER SOURCE: AC 220V 50/60 Hz. DC 9V U1 x 4 PCS. ANTENNA: SW 1/2 wave dipole. FM and VHF — rod antenna. DIMENSIONS: 12½" L x 8½" H x 4" D.

**SPECIAL PRICE** **\$65**

Post  
Pack  
\$3.00

## MULTI-BAND RADIO

## SPECIFICATIONS:

Circuit: 16 Transistors, 16 Diodes, 1 Varistor and 2 Rectifiers.

Frequency Range: AM 535-1605 kHz. FM 88-108 MHz. TVI 56-108 MHz. TV2 174-217 MHz. AIR/PIBZ 110-174 MHz and WB 162.5 MHz.

Power Source: AC 240 Volts 50 Hz 4 Watts, DC 6 Volts.

Power Output: 350 mW (max.) 250 mW (undist.)

Dimensions: 9½" x 3¾" x 2".

Weight: 4½ lb. (approx.)

Supplied Accessories: Earphone, Batteries (4 size D).

\$49.00 — Postage \$2.50

## HANIMEX AM/CB/FM SOLID STATE PORTABLE RADIO Model 2818

## OWNER'S GUIDE — Operating Instructions.

## SPECIFICATIONS:

Semiconductor Complement:

22 Solid State Devices (11 transistors, 11 diodes).

Frequency Range:

AM450-1600 kHz, CB channel 1-40, FM 88-108 MHz.

Intermediate Frequency:

AM/CB 455 kHz, FM 10.7 MHz.

Output Power:

300 mW Maximum, 10% Distortion 200 mW.

Speaker:

3" 8 ohm Dynamic.

Power Source:

Battery 9V "A-A" size.

Antenna:

AM Ferrite Bar Antenna, CB/FM Rod Ant.

Dimensions:

7" Height x 3.5" Width x 1½" Depth.

Weight:

1 lb. (without Battery).

**\$27.90 — Postage \$1.50**

## E.E.I. SOLID STATE CAR RADIO MW BAND

## PUSH-BUTTON TUNING

## SPECIFICATIONS:

Power Supply: 12 V DC

Receiving Frequency: MW 520KC (580M) — 1640KC (183M)

Intermediate Frequency: 455KC

Audio Output: 4.5W

Transistors: 8, diode 4

Speaker: 5" Permanent Dynamic 4 ohm

Sensitivity: Less than 20 uV at 20 N/S

Selectivity: More than 25 dB at +10 kHz  
detuning

A.G.C.: More than 45 dB at 1,000 kHz

IF Rejection: More than 40 dB at 600 kHz

IM Rejection: More than 50 dB at 1,400 kHz

Cabinet Dimensions: 1-7/8" (W) x 6-1/8" (H) x 4-1/8" (D)

**\$35.90 — Free Post**

## BARLOW-WADLEY-XCR-30

a truly portable communications receiver, based on the WADLEY LOOP principle, the same principle as applied in the

DELTAHET and RACAL receivers. A truly crystal-controlled highly sensitive multiple-heterodyne portable receiver of exceptional stability with continuous, uninterrupted coverage from 500 kHz to 31 MHz.

All for **\$310.00** F.O.R.

## QSP — REQUIEM

We have lost a frequency band — temporarily, we are told. All amateurs voice alarm when any privilege is lost; whether or not they themselves used that privilege to any appreciable extent is immaterial.

As has already been reported last month the Institute has been active in seeking adequate compensation for this loss. With this must be linked the staffing position of the Department.

The new Novice segment on 10 m is one spin-off. A letter was sent to the Department about Third Party privileges for radio amateurs. Additional frequency allocations form part of the WARC 79 negotiations by the WIA. The text of the Institute's submissions is printed in full elsewhere in this issue.

The Institute's attitude to CB was reached after consultation amongst all Divisions and represents the view of the majority. However, the whole matter raises the question of whether other amateur frequencies are vulnerable to "strong arm" pressure groups in Australia. ITU and WARC 79 must be considered a special case in their own right.

Membership in a strong WIA is the only hope for the future of radio amateurs in Australia. A weak Institute has little bargaining power and an ineffective lobby.

That is one message for us all.

The second message really need not be spelled out. If you have any complaints take them to your Division. Tell the WIA about them.

Please remember, we are not running a dictatorship. The Institute arrives at a collective decision based on what the membership wants.

D. A. WARDLAW VK3ADW,  
Federal President.

## **HF TRANSCEIVERS**

ASTRO - 200 digital solid state 200 W.P.E.P.

TRIO KENWOOD new model TS-520-S

160 to 10 M, with optional digital readout connected externally. Can be used as a frequency counter self contained separately powered by 12 volt DC. Price will be shortly announced.

TRIO KENWOOD model TS-820S AC only 160 to 10 M with digital readout.

TRIO KENWOOD model TS-820 AC only 160 to 10 M.

TRIO KENWOOD model MC-50 Microphone.

TRIO KENWOOD model TS-700 - A FM-AM-CW-SSB transceivers. Full 144-148 MHz coverage, 10-Watt output, VFO controlled, self-contained, AC-DC operation.

TRIO KENWOOD model TS-600-A FM-AM, SSB transceiver full 50-54 MHz coverage 10 Watt output variable from 1 Watt to full power. VFO controlled AC-DC operation. Styling as TS-700-A.

TRIO KENWOOD model TR-7400 2 meter FM transceiver 10 to 25 watts output.

Frequency range 144.00 to 147.995 MHz No. of channels 800, Double conversion super-heterodyne sensitivity better than 0.4 UV for 20 DB.

Universe 224 model 15 watts pep 23 channel AM SSB for as low as

Universe base 240V and 12V DC. The best value for money

only

## **ICOM**

### **VHF TRANSCEIVERS SSB**

ICOM model IC-202 2 M SSB portable transceiver 144-144.4 MHz

ICOM 22-S synthesized 22 channel 2 M transceiver 10 channel pre programmed. Supplied with 50 extra diodes for the programming.

ICOM model IC-502 6 M SSB portable transceivers 52-53 MHz.

YAESU MUSEN model FT-101-E AC-DC transceivers 10 to 160 M with speech processor

YAESU MUSEN model FT-301.

YAESU MUSEN model FT-301 - D

YAESU MUSEN model FT - 301 - S

YAESU MUSEN model FL-2100-BLineal Ampl.

YAESU MUSEN model FP - 301

YAESU MUSEN FR G-7. Uses Wedley loop princ.

YAESU MUSEN FT221-R 2 meter all mode transceiver.

# WIANEWS

The main news is published elsewhere in this issue, namely, a consolidated list of the numerous items the Institute has submitted to the Postal and Telecommunications Department.

This sets out the fears expressed about amateur bands in the future, apprehensions about the staff shortages in the Department, and various submissions for streamlining the system.

On the question of frequency allocations the reader of AR will be aware of the preparations being made for WARC 79 and what the Institute, in collaboration with IARU, have put forward. These details, perhaps forgotten by many people, were broadly set out on page 28 of AR for July 1975 (please note the "400" therein was a typographical error for 4000). Please see IARU News herein for further details.

At the July Executive meeting suggestions coming forward from various sources were examined but no decisions could be reached in the absence of policies from the Federal Council. Increased power for Novices was one such item. Another related to the amount of pressure the Institute deemed desirable in relation to additional HF frequencies. It was agreed to proceed with the submission for additional 2 m repeater channels via a postal vote.

The proposals put forward by the VK4 Division for recommended conversion frequencies to the 10 m band for Novices' channelised 11 metre gear were considered as the most acceptable and will go forward as a postal vote to Divisions. Basically this means that the 23 Novice channels will be directly translated upwards by 1.335 MHz. Thus the 11 m band Ch. 1 becomes 28.3 MHz, Ch. 2 becomes 28.31 MHz and so on. On some sets tested in VK4, changing only one row of crystals provides the 6 primary frequencies on USB and AM (LSB is not used on 10m) of 28.3, 28.35, 28.4, 28.45, 28.5 and 28.55 MHz and also results in minimising spurious emissions in some cases. This is considered better than changing vertical column frequencies as 28.3, 28.31, 28.32, 28.34 in the first column and so on for the 6 columns (27.255 to 28.57) and 28.6 omitted because USB would be outside the Novice segment. It appears reasonable to anticipate that this postal motion will be passed.

On 27th June a letter was addressed to the P. and T. Department pointing out the concern felt by the Institute for many years about the absolute prohibition on third party traffic, particularly the effect of this on training for, and involvement in, emergency situations. It was pointed out that the basis of Government policy had always appeared clear, namely, the protection of revenue in the preservation of its own monopoly of communications.

But this must now be assumed to have changed by the introduction of the CB service acknowledging the needs and desires of a section of the community being given priority. The change is welcomed because if it can be extended to the amateur service it will enable that service to play an even more meaningful role in the community by gaining experience in message handling on behalf of others.

Not desiring to move away from the amateur service definitions in the ITU Radio Regulations, the Institute suggested that in the flow-on from the decisions already made, it proposes that a regulation similar to the FCC's 97.114 should be adopted in Australia as a matter of urgency.

The letter concluded with the comment that the adoption of this course would play a significant part in minimising conflict between the Department and amateur licensees, since this had been the basic cause of so many past disputes.

As a matter of interest, FCC regulation 97.114 deals with third party provisions applicable in the U.S.A. International third party traffic is prohibited between the U.S.A. and any country which has not agreed to such traffic for its amateurs — i.e. Australia, etc. ITU Radio Regulation 1562 allows third party amateur traffic to be conducted between countries for which the administrations concerned have made special arrangements.

Another letter to the Department in July dealt with beacons in the 10 m band. ■

# A LOW COST VIDICON AMPLIFIER

Andrew Pierson,  
1 Bindens Ave., Salisbury Park 5109

For the home-brew ATV enthusiast this article will be a very helpful reference regarding the parameters involved in video amplifier design and their importance in the easily-reproducible amplifier described.

At present, many television cameras are in the process of construction by amateurs, and also by others with no direct amateur radio interest. The uses to which these cameras will be put are very diverse, varying from straightforward closed circuit television to use with an ATV transmitter on UHF or microwaves. The current popularity of amateur slow scan techniques has generated a new demand for the CCIR standard TV camera, because the setting up procedure is less arduous than with a direct slow scan unit. The fast scan pictures may then be converted to the slow scan format by a simple sampling process.

Although commercial cameras (usually employing the 2/3 inch vidicon, and of Japanese origin) are readily available, the price tag of between \$200 and \$500 is fairly steep. Consequently, many people have decided to "brew their own", and learn something about TV in the process. Everyone who attempts this, however, finds himself somewhat of a "loner" because of lack of standardization in deflection assemblies, etc. The precise circuit each constructor chooses will therefore depend on which deflection yoke he has managed to beg, buy, cadge or (brave man!) wind himself. There are also a fair number of circuits around which specify components and circuit configurations that have since become obsolete. One of the worst examples of this has been that of the vidicon amplifier (sometimes referred to as the "head" amplifier). More often than not, the transistors which are specified are expensive and difficult to obtain. Also, the older transistor circuits often exhibit poor S/N ratios, which does not help the man who is trying to achieve a reasonable picture indoors under normal lighting conditions whilst using a modest lens. A vidicon obtained because it has "done its hours" will probably be down in sensitivity, which is not going to help matters.

Whilst it is easy to specify exotic transistors for vidicon amplifier designs, it is

also possible to utilise devices like the humble BC109, which for its 20 cents or less gives you low noise performance, high current gain and an FT of 300 MHz. Used properly, I reasoned that this and similar devices could be employed in a very low cost good quality vidicon amplifier. With these facts in mind, I set about designing and building an amplifier specifically for amateur television purposes, and which would satisfy the following requirements:-

- (1) Low cost
- (2) Easy-to-obtain components
- (3) Simple circuitry
- (4) Good bandwidth (resolution)
- (5) Low noise performance
- (6) Stable performance
- (7) Easily reproducible
- (8) Simple to set up
- (9) Plenty of reserve gain for low-output vidicons.

I am very happy to say that these aims have been achieved, and in fact, two designs were produced. The first is presented here, and represents the simple, low-cost approach to a vidicon amplifier. The second design uses more components, but provides ultra low noise performance (FET output), and also facilities for line-by-line clamping, signal blanking, sync insertion and a 75 ohm cable driver output. This more sophisticated circuit will be the subject of a later article.

The circuit shown (Fig. 1) is that of the low cost (Mk I) design, and is the result of the initial work carried out. The amplifier uses four BC109's and two 2N3636A's, which can be bought anywhere; the remaining components are only R's and C's. Before continuing with the circuit description, the basic operating principles and requirements for a vidicon amplifier will be briefly discussed.

## PRINCIPLES OF OPERATION

The signal output circuit via the photoconductive target of a vidicon has a characteristically high impedance, and behaves essentially as a constant current source. Operating bias must be applied to the target from a positive DC potential, and is supplied via the target load resistor. The video signal voltage will therefore be developed across this resistance. Since the current is essentially constant, the larger the value of load resistor the greater will be the amplitude of the developed video signal. This should make the amplifier design easy, but this is not so because another factor lurks — the target shunt capacity and also that capacitance introduced by wiring, together with the input circuit of the amplifier. These will total about 10 to 20 pF. If a high value of load resistor is employed (say 1 Megohm), the shunting effect of these capacities will be very serious at the top end of the video spectrum being produced. (Generally

speaking, an Industrial camera will produce frequencies of up to about 5 MHz and a studio camera up to about 10 MHz, although there are exceptions in both cases). The roll-off will have the simple slope of 6 dB/octave or 20 dB/octave, and must be compensated for in the amplifier by introducing a characteristic with an equal but opposite amplitude Vs frequency slope.

The alternatives now become clear. A low band load resistor will produce a low level signal which means that the wide band voltage gain of the amplifier must be high. However, due to the fact that capacitive losses are minimised, the amount of compensation required will be small. On the other hand, a high value load resistor will produce a large signal which requires little low frequency amplification, but due to the high capacitive losses involved the amount of compensation required will be great.

The initial consideration in any vidicon amplifier design is generally a trade-off between the factors just outlined. The low value load resistor approach gives more flexibility in use, since a change in shunt C will not have such a drastic effect on the overall compensation requirements. A disadvantage is that the internal noise produced by the amplifier is spread further over the whole video frequency spectrum than in the case of a high value load resistor, where most of the amplifier gain is concentrated towards the high frequency end. A given RMS value of low frequency noise is much more objectionable than the same RMS value of high frequency noise, since it results in intermittent "streaking" rather than the usual fine speckly "snow". The high value load resistor wins on this point, but if the value is made too large the amount of compensation then required results in excessive high frequency noise. Also, the amplifier's compensation characteristic will have to be altered if for any reason the overall shunt capacity changed (e.g. a vidicon replacement). Note that the effective signal load impedance may not necessarily be equal to the value of the physical target load resistor, because the input impedance of the amplifier will appear in parallel with this resistor, as far as the AC coupled video signal is concerned.

## CIRCUIT DESCRIPTION

In the amplifier design presented, a "medium" value of video load resistor has been chosen, in order to balance the benefits obtainable from both approaches. The input circuit of the amplifier proper (Q3-Q6) has been buffered from the target load circuit by means of the super-alpha pair (Q1-Q2), so that the actual video load impedance is approximately 100 k ohms (the first emitter follower's bias feed resistor) in parallel with 470 k ohms (the target bias feed resistor).

The target bias voltage is supplied via a 100 k ohm resistor, and a 100 nF capacitor to ground forms a low pass filter to ensure that no spurious signals are passed to the amplifier via the target bias voltage supply.

The bias divider for Q1 is decoupled with a 100 uF electrolytic and a 100 nF Hi-K ceramic capacitor, which serves as a bypass at high frequencies where the inductive effects of electrolytics may tend to become troublesome.

Q3 is a DC coupled common emitter, compensated amplifier stage with a DC/LF gain of 20 dB. Adjustable low frequency (smear) compensation is applied by emitter regeneration to Q3.

Q4 is a DC coupled phase reversing stage with a DC/LF voltage gain of 1. However, this arrangement leaves the remainder of Q4's current gain available for high frequency compensation, again applied by means of emitter regeneration.

Q5 is a DC coupled common emitter amplifier stage with a DC voltage gain of 1, but the wide band AC gain is set by the emitter decoupling network consisting of a 47 ohm resistor and a 1000 uF electrolytic capacitor. Under these conditions, the wide band AC gain is given by the ratio

$$\frac{470}{470 \times 47} \text{ or } 11.0$$

The above relationship does not take into account minor loading effects due to the input impedance of the emitter follower stage Q6.

Q6 is a DC coupled emitter follower output line driver stage. Under quiescent conditions, the DC voltage appearing at the emitter of Q6 is +10V, and the overall amplifier +12V rail drain is 50 mA. These figures will vary between individual unit samples, due to spreads in transistor parameters and resistor tolerances. A variation of  $\pm 500$  mV from the nominal +10V at the emitter of Q6 would be permissible, and a check of the voltage at this point

is a quick and convenient method of determining if the amplifier's DC operating conditions are normal. The dissipation requirements of Q6 are minimised by including two 100 ohm series resistors in its collector circuit. Sufficient voltage is still maintained across Q6 to provide an adequate output voltage swing. The emitter circuit of Q6 is decoupled from the rail by a 10 ohm resistor and a 1000 uF electrolytic capacitor. An additional 100 nF Hi-K ceramic capacitor is connected across the large value bypass to maintain decoupling at high frequencies. The maximum output of the amplifier is 1V p-p from blanking level to peak white, which is positive-going.

In the days of valve camera chains, the large physical size of the equipment made it necessary to place in the camera head only that circuitry which was absolutely essential for its operation. The remainder of the circuitry was contained in the camera control unit, located at some distance from the camera and connected to it via a multi-core cable. Under these circumstances, the output of the vidicon amplifier was required to drive a coaxial cable. However, the advent of transistorised equipment has largely meant the demise of the two-unit camera, since all of the circuitry may be located in the camera unit itself. And so it is that the output circuit of the modern vidicon amplifier has generally a higher impedance, because the sync assembly circuit which it feeds is close by — many times on the same PC cards.

The design of a general purpose amplifier such as described here imposes a few more restrictions on output impedance, because it is likely to be connected to a variety of circuits with differing impedances and shunt capacitors. Since it is desirable that the compensation characteristics of the amplifier be not influenced by variations in output capacitive loading, the output circuit has been arranged to present a driving impedance of 75 ohms to the connecting cable. Because of this arrange-

ment, the amplifier will drive at least 3 metres of 75 ohm coaxial cable without the need for a terminating resistor at the receiving end. The output is AC coupled via a 100 uF electrolytic capacitor, and will drive circuitry with input impedances of 500 ohms and upwards. The 10 k ohm resistor across the output line has a small value when compared to the leakage resistance of the coupling capacitor, thereby preventing the occurrence of a DC potential at the output terminal when no load is connected.

It will be seen that the use of DC coupling between stages has considerably reduced the cost and complexity of the amplifier by eliminating electrolytic coupling capacitors and bias resistor networks. The main +12V supply rail is bypassed with a 1000 uF capacitor, together with a 100 nF Hi-K ceramic capacitor for the same reasons as described earlier.

#### CONSTRUCTIONAL DETAILS

The amplifier may be constructed using hard-wired or PC card techniques. Veroboard is also suitable. Whatever the method of construction, two important considerations must be observed if stable performance is to be achieved. The first is that the component placement should be such that the signal progresses logically from left to right, or vice versa. In other words, the isolation between input and output should be at a maximum. The second consideration involves the supply and earth rails. In order to avoid trouble from common impedance paths, the rail conductors should be as heavy as practicable. If you feel doubtful about this aspect, additional 22 uF, 16V tantalum "tag" electrolytics (which have good high frequency characteristics) may be used across the +15V and earth rails at various points throughout the circuitry.

The ideal physical construction for amplifiers of this type is to hard-wire the components between tagstrips inside a die-cast box. However, this circuit is very "lame", and recourse to this action should not be necessary.

#### COMPONENT TYPES

For the sake of convenience, all resistor values specified are from the E12 series and are easily obtainable, but they should be good quality 5 per cent tolerance,  $\frac{1}{4}$  or  $\frac{1}{2}$  watt cracked carbon or metal film types. The compensation adjustment potentiometer must have a non-inductive (e.g. carbon) element. All electrolytics are etched aluminium foil types, and the remaining capacitors are split into Hi-K ceramics and polyester film "Green-caps". The BC109's and 2N3638A's may be by any manufacturer, provided that they meet the original specifications for these devices. This is very important, and substitute types should NOT be used.

#### INSTALLATION

It is imperative that the connection between the vidicon target ring and the input of the amplifier be as short as possible, and that stray capacity to ground be kept to an absolute minimum. Also, the general area surrounding the target and amplifier

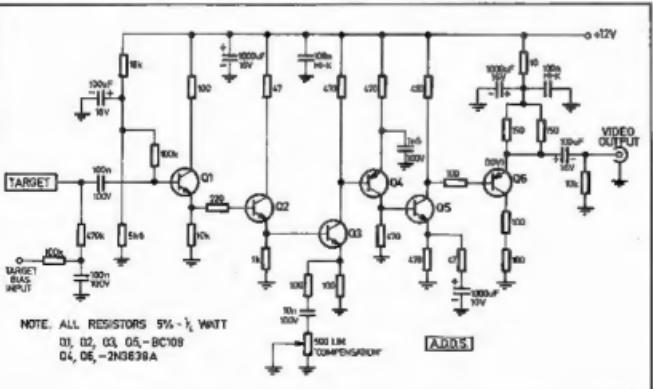

FIG. 1: Schematic of Low Cost Vidicon Amplifier.

input should be shielded to prevent the entry of spurious signals. These two requirements conflict to some extent, so commonsense should be the guide. Try to keep the input lead less than 25 mm long, and at least 5 mm away from all other earthed objects. The lens mounting plate MUST be earthed. If this is not so, RF interference will enter the amplifier by capacitive coupling when the lens is touched during focussing, etc.

#### ADJUSTMENT PROCEDURE

The compensation adjustment is simplicity itself. At one end of the potentiometer's travel, black objects in the observed picture will give rise to a following black smear. At this position the amplifier's +3 dB "corner" frequency is above the -3 dB corner frequency of the low pass filter formed by the effective load impedance and the total input shunt capacity. Under these conditions, the amplifier is said to be "undercompensated".

At the other end of the potentiometer's travel, black objects will give rise to a following white smear. This indicates that the amplifier is "overcompensated", because its +3 dB corner frequency is below the -3 dB point of the signal input network. The correct potentiometer position is that setting which does not produce any smear at all.

#### SENSITIVITY

In terms of internally generated noises and overall sensitivity, the performance of the prototype amplifier was very pleasing. When using a normal 1 inch vidicon with a target voltage of +50V, an f1.4 25 mm lens, and an inside scene under fluorescent illumination, the output from the amplifier was 1.5V p-p. The picture was clean and finely graded, displaying excellent amplitude linearity.

#### NOISE

With a short circuited input, the output noise was 60 mV p-p. However, due to the compensation characteristic of the amplifier this figure is correct only for the upper end of the video frequency spectrum, where it is practically invisible. For lower frequencies, the noise amplitude decreases at the rate of 6 dB/octave.

#### APERTURE CORRECTION

Whilst amplifier compensation has been discussed at some length, another form of compensation is required when one is seeking the very best from a camera tube. This is termed "aperture correction", and its need arises because the cross section of the scanning beam is not rectangular and infinitely small, but circular and of finite size. The required correction curve has a more complex function than  $\pm 6 \text{ dB/octave}$ , and may be compensated for by using a circuit which possesses a frequency response equal to the inverse of the frequency characteristic produced by the aperture effect. Since the frequency roll-off caused by a symmetrical aperture introduces no phase variation with frequency, the correction circuit should likewise be free from this effect.

Practically, delay line circuits or T-section equalizing networks are used, but

a reasonable approximation for aperture correction may be made by increasing the amount of HF amplifier compensation to above that value which will theoretically fully correct the amplifier. In any case, it is not very important, and is only worth worrying about when one is seeking resolution in the 500-800 line region. Few industrial cameras include proper compensation for the aperture effect. I have adopted the "over-compensation" compromise, since it involves less circuit complexity and avoids the necessity for inductances.

Because the final value of equalization is usually arrived at empirically, it is difficult to ascertain the point at which the normal 6 dB/octave compensation leaves off and the additional aperture correction lift takes over. If you are using an average TV receiver for a monitor, it is doubtful whether the difference between this form of aperture correction and that provided by more sophisticated circuits could be detected anyway.

#### RESOLUTION

The resolution of a television system may be defined as the total number of alternate black AND white vertical bars PER PICTURE HEIGHT which can be discerned when the system is used as a medium for visual image transmission.

The accepted method for determining the resolution of a television camera is to televise a bar chart which contains several sets of vertical stripes which, when placed at a certain distance from the centre, correspond to various increments of resolution or frequency. The resulting video output from the camera is observed on a wide-band oscilloscope or video waveform monitor, and the percentage response at each step is noted.

A more widely used (but not so comprehensive) method is by making use of the resolution wedge, which is an integral part of most standard TV test patterns, e.g. the Marconi Resolution Chart No. 1. By observing the point at which the converging lines disappear, the overall limiting resolution of the camera, transmission system (if used), and monitor may be determined. The method is fast, but does not give any detailed information about the overall frequency roll-off characteristic. Only a few per cent of signal is required to give an indication of wedge line continuity (5 per cent or -26 dB is a popular figure), so if the maximum resolution is judged to be, say, 5 MHz, it means that there is very little signal left at this point, and the roll-off may have commenced several MHz before. It is also a fact that only a small percentage of high frequency signal is required to give an image the appearance of sharpness, so the whole system is quite acceptable. The monitor is also included in the resolution check, which makes it very useful for amateur applications.

The point at which the total signal amplitude as observed on the screen of the monitor falls below the level necessary to observe wedge line continuity depends on

the algebraic sum of the following frequency characteristics:—

- (1) The output signal from the camera tube target, which also implies:
  - (a) Optical focus
  - (b) Scanning beam spot size
  - (c) Target granularity.
- (2) The frequency characteristic of the camera tube amplifier. Neglecting aperture correction, the +6 dB/octave lift from the amplifier will oppose the -6 dB/octave loss from the input circuit. This process will result in an overall flat amplitude Vs frequency characteristic until the amplifier's compensation circuits run out of gain. The response will then fall at a rate of 6 dB/octave, plus the amplifier's roll-off value.
- (3) Losses involved in camera processing and transmission.
- (4) The frequency response of the monitor's video amplifier.
- (5) The spot size of the scanning electron beam in the display CRT.

Because of practical difficulties associated with simulating precisely the target circuit of a vidicon camera tube, a direct specification of the amplifier's amplitude Vs frequency characteristic has been avoided. However, to cut a long story short, if you use a normal 1 inch vidicon in the low voltage beam acceleration mode (approximately +250V to +300V) and a modified TV receiver as a monitor, you can expect to resolve at least 450 lines on the monitor screen. This corresponds to 5.625 MHz, which is well above the transmission bandwidth limit anyway. If you use a 1 inch vidicon in the high voltage beam acceleration mode (approximately +600V to +700V) and a high bandwidth monitor, you can expect much better resolution figures.

#### LOW FREQUENCY RESPONSE

The capacitive coupling elements employed have a sufficiently long time constant that no appreciable frame (50 Hz) tilt appears on the output video waveform.

#### GAMMA

This is the final parameter which should be discussed, and is the relationship between the light input to the vidicon target and the corresponding signal current output (transfer characteristic).

Since the object is for the overall television system to be able to reproduce a maximum number of shades of grey, the gamma of the camera tube should exactly complement the gamma of the displaying CRT, which is approximately 2.2. However, a system with an overall gamma of unity produces pictures which have a rather flat appearance. This effect may be offset to a large extent by making the overall gamma slightly greater than unity, e.g. 1.1 or 1.2.

Since the input Vs output voltage characteristic of this amplifier is linear and the gamma value for a vidicon is between 0.5 and 0.6, an acceptable overall gamma figure is achieved without the need for a non-linear correction amplifier. ■

# AN IMPROVED 45 WATT TWO METRE BOOSTER AMPLIFIER FOR FM OR SSB

By Roger Harrison VK2ZTB  
and Phil Wait VK2ZZQ

This amplifier originally appeared at the Central Coast Amateur Radio Club Convention in February 1976 and was subsequently described by the authors in the April 1976 issue of ELECTRONICS TODAY INTERNATIONAL, designated "project 710". Its intended purpose was to amplify the output of the many popular two-metre FM transceivers, which generally have an output power of around 10 watts, to a level of 35-45 watts. The amplifier used the then popular 2N6084 RF power transistor, which was at that time readily obtainable and not expensive. The amplifier featured printed inductors and diode antenna changeover switching. Many people have successfully constructed this amplifier, judging by the number encountered on air.

However, some constructors have experienced difficulties with certain shortcomings of the 2N6084. Their minimum gain is specified as 4.5 dB, which means it will only give 28W output for 10W drive under the specified conditions. Raising the supply voltage and drive power improves matters if a min-gain transistor is encountered but you don't get something for nothing—efficiency is poor. Some transistors proved to have less than their specified minimum gain. Some transceivers also, proved to have less than their specified output power! The occasionally encountered combination resulted in output powers of less than 20W from the amplifier! This caused gnashing of teeth, tearing of hair and cursing of authors !!\$?\*\$\$! Ducking tomatoes at radio club meetings is not a habit the authors wish to cultivate.

Another problem arose concerning the combined shortcomings of operators and 2N6084's. Although the 2N6084 is assuredly "rugged" according to the data book, and "...resists transistor damage caused by load mismatch", they cannot be treated in a similar manner to valves. Alas, some transistors—and attached bank accounts—have come to grief. It is unwise to apply drive without the power supply connected to the amplifier. Mismatched antennas should likewise be avoided. Some individual transistors "resist" abuse better than others.

Apart from its application with FM transceivers, there were many people desirous of having a linear amplifier of similar specifications, for use with SSB on two metres. The authors received a number of on-air enquiries as well as a spate of letters on this subject. Attempts to employ

the 2N6084 in linear mode, while moderately successful, showed up a few more limitations of the device. Gain in class B (or AB) proved to be less than its gain in class A. Comment on the linearity would likely be defamatory. It is possible, by selecting devices, to construct a passable linear using the 2N6084 but that may prove expensive at around \$17 per device!

The solution to these irksome problems is found by modifying the circuit to use a CTC transistor, the B40-12. In actual fact, the modifications are quite minor. The circuit, showing the new configuration and changed components, is given in Figure 1. Linear operation is discussed later.

The B40-12 has a minimum specified gain of 5.5 dB at 175 MHz which results in an output of at least 35 watts from 10 watt drive. Its gain at 146 MHz is higher. Experience shows that B40-12's generally exceed their minimum gain specification. They are rated to withstand an infinite VSWR at full drive with 15.5V supply applied. This makes them somewhat more rugged than the 2N6084. Thus, whilst abuse is not encouraged, open or short circuit antennas and operator mishaps, etc., are not likely to be disastrous, or expensive.

## THE DIODE SWITCHING CIRCUIT

The original article specified 10 x 1N914 (or 1N916, or BAX13) diodes for the diode changeover switching circuit. Better diodes are the Philips BAV10 and, as they are adequately rated for the powers encountered, only six are required as shown in Figure 1. Take care when tuning up that you don't short either C5 or C7 as this will cause at least one of the diodes to be overloaded and they will go open circuit (pphhuttiangg!!!).

## RFC's

The base choke, RFC2, is changed, now consisting of a miniature RFC (of the un-encapsulated or the moulded variety—whichever) having a value anywhere from 0.15 uH to 0.27 uH with a 4 x 1.5 x 9.5/F8 Neosid suppression bead slipped over the lead from the RFC to the base of the transistor. This "combination" chow mein ... er, base choke ... should be mounted as close to the base as possible—right up at the transistor header.

The collector choke, RFC3, is wound with more turns and is a smaller diameter than that specified for the original circuit.

## MISCELLANEOUS COMMENTS

Note that C6, which was a 60 pF trimmer (ELMENCO A4004/OX) is now changed to a higher capacity—the 15-115 pF type (ELMENCO A4006/OX or similar). Any suitable trimmer having a maximum capacitance greater than this however will be satisfactory.

The component layout is exactly the same as in the original amplifier and the general construction and tune-up details remain pertinent.

## PERFORMANCE

With the full 10W drive, using a 12.5-13.5V supply, driving a dummy load or well-matched antenna, at least 35W output should be obtainable. Generally, 40-45W would be more usual, and sometimes as much as 50W or so. More can be obtained, but the maximum collector current and maximum dissipation of the B40-12 should not be exceeded. Better efficiency is also more readily achieved with the B40-12 than with the 2N6084.

## SSB OPERATION

A simple diode base circuit, as shown in Figure 2 is quite satisfactory. A 1000 pF feedthrough capacitor or ceramic "button bypass" capacitor is mounted on the PC board adjacent to the grounded end of RFC2 to form a "standoff bypass".

The base choke, RFC2, is then mounted between this and the transistor base. The silicon power diode, two ½W resistors and the trimpot may be mounted in any convenient position. If you wish the diode to be thermally connected to the transistor, in order to provide a measure of thermal tracking, it may be glued to the cap of the B40-12. Use a strong, quick-setting glue such as "Bondza" or "Super Glue". This refinement is not all that necessary though.

The diode switching arrangements as configured will not work with SSB. Two changeover relays, operated from the transceiver Tx/Rx circuitry are recommended. Alternatively, a bias network to provide DC bias switching for diodes could be devised to effect fully solid-state changeover switching.

To set up the amplifier for SSB operation, a suitable power meter, power supply (preferably variable current-limited) and a dummy load should be attached. Insert a current meter in the B40-12 collector supply line. The maximum allowable collector current is 7.0 amps. Observe it.

Set the 470 ohm trimpot to maximum resistance initially. Connect the power supply and adjust the trimpot for about 150-300mA of quiescent collector current.

Next, apply a small amount of drive so that there is some increase in collector current and tune C5, C4 and C6, C7 to obtain a peak in the power output. Further increase drive and again peak C4, C5 and C6, C7. If all is going well, apply full drive and peak the trimmers again for maximum power output. About 30-35W PEP minimum should be obtained with 10W PEP drive.

If desired, linearity may be checked by simultaneously monitoring input and output power and making measurements over a range of power levels. The ratio of output to input should remain almost constant until the point where the amplifier begins to flat-top and output compression occurs. That is, an increase in drive power does not cause a corresponding increase in output power.

If you can arrange to listen to your own signal, so much the better. Some adjustment of the quiescent collector current may be necessary to improve linearity. The values quoted provide a starting point. Individual transistors have different characteristics and the collector current is best adjusted in service for best linearity.

Copies of the original article are obtainable from Electronics Today (at 15 Boundary Street, Rushcutters Bay 2001) for 48c per page. The article commenced on page 86 of the April 1976 issue and continued on pages 87 to 91 inclusive (six pages).

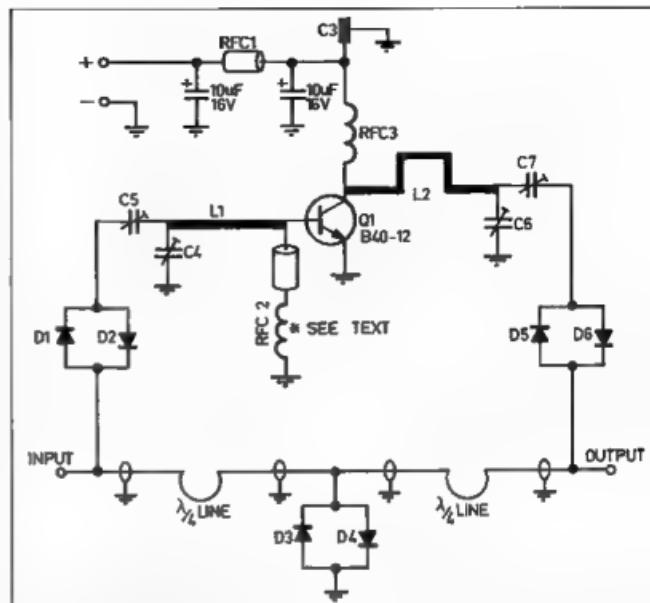

FIG. 1: Modified version of the ETI 710 amplifier employing a B40-12.

6 x BAV10 diodes may be substituted for the 10 x 1N914 or 1N916 diodes specified for the original diode switching circuit.

The 2N6084 is replaced by a CTC B40-12. C6 is replaced by a 15-115 pf Trimmer

(or greater range) such as the ELMENCO A4006/OX.

RFC2 is replaced by a combination choke — a 4 x 1.5 x 9.5/F8 bead is slipped over one lead of a 0.15 to 0.27 uH miniature RFC.

RFC3 is changed to 6 turns, 18 swg tinned or enamelled wire, 5 mm inside diameter, 15 mm long. No resistor in parallel.

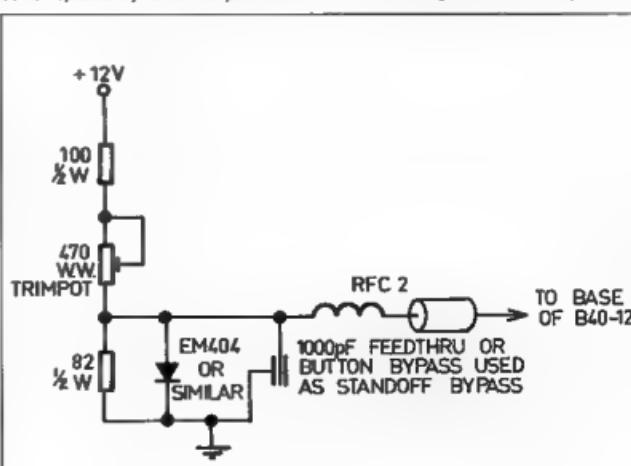

FIG. 2: Suggested Bias Arrangement for SSB Operation.

PRINTED CIRCUIT BOARD MOUNTING TRANSFORMERS

Each transformer has two identical windings which may be series or parallel connected.

SPECIFICATION OF STOCK RANGE

| Type No. | Series Connections   | Parallel Connections  |
|----------|----------------------|-----------------------|
| PL 6/5VA | 6 volts at 0.63 amp  | 3 volts at 1.67 amp   |
| PL 9/5VA | 9 volts at 0.56 amp  | 4.5 volts at 1.11 amp |
| PL12/5VA | 12 volts at 0.42 amp | 6 volts at 0.83 amp   |

VARIATIONS AND FEATURES

- Double insulated, plastic enclosed, designed to comply with relevant clauses of Australian Standard Codes and Telecom Australia Specifications.
- If required, quick connect terminals enable mains voltages to be kept clear of PC Board.
- May be supplied without plastic enclosure, if size is significant, which reduces dimensions to H: 30mm, W: 38 mm and L: 51 mm.
- Variation in volts from No Load to Full Load (SVA) is approximately 15 per cent.
- The transformers may be loaded to 7VA with an extrapolation of regulation.
- Provision is made for five pin terminals and two quick connect terminals at each end, suitable combinations may be manufactured to order.
- Plastic mounting lugs enable transformers with quick connect terminals to be fitted to metal chassis.

Height 34 mm  
Width 42 mm  
Length 65 mm

# THE NEW TS-520S

A NEW  
STANDARD IN  
ECONOMY  
TRANSCEIVERS

Full coverage 1.8 to 29.7 MHz    Outstanding Receiver Sensitivity and Minimum Cross Modulation    Vernier Tuning for Plate Control  
□ High Q effective Noise Blanker    □ New Improved Speech Processor    □ RF Attenuator    □ Easy connection to Phone Patch    □ Fully compatible for optional 6-Digit Read-out.    PRICE: TS 520S — \$650.

KENWOOD TS520 HF TRANSCEIVER

The pacemaker, provides superior performance, versatility and features found in no other Transceiver. \$980.

KENWOOD TR 7400A FM VHF TRANSCEIVER

Full 4 MHz coverage 25 watts high, 5 to 15 watts low, offset for Repeater. Fully synthesised, 6-Digit Read-out. PRICE \$385.

KENWOOD MATCHING ACCESSORIES

ICOM MODELS IC202, IC245, IC211, IC225

We can also supply from the YAESU MUSEN range, the FT301D, FT301S, FT221R, FRG7 communication receiver.

## TRANSVERTER MODEL MMT432/144

UTILIZING an IF of 144 MHz ★ 10 WATTS DRIVE or ½ WATT  
★ VOX OPERATED

This 432 solid state linear transverter is intended for use with a 144 MHz transceiver to produce a high reliability transceive capability. A 10 watt load and RF sensing network eliminates the need for any ancillary circuitry. A single coaxial connection is all that is required between the transverter and the associated 144 MHz transceiver.

A wide range of applications is offered by this MMT432/144 transverter, which by virtue of its linear mode of operation will enable 144 MHz SSB, FM, AM or CW equipment to be used at 432 MHz.

**Simply connect direct to your 2 metre rig, 12 volt supply, fit 70 cm antenna for instant SSB, FM, AM, CW operation.**

**FEATURES** High quality double-sided glass fibre printed board ★ Highly stable zener controlled oscillator stages ★ PIN diode aerial changeover relay with less than 0.2 dB through loss ★ Extremely low noise receive converter, typical 3 dB ★ Separate receive converter output gives independent receiver facility ★ Built in Automatic RF VOX with override facility ★ Built in 10 watt 144 MHz term nation, selectable attenuator for ½ watt ★ Use of the latest state of the art Power Amplifier transistors provide reliable 10 watts continuous output

**MODEL MMT432/144 — Price \$260**

## NEW RELEASE - TRANSVERTER

### MODEL MMT432/28S

**Features extended coverage for Oscar 8.**

Second Crystal Oscillator gives two ranges: Low, 432-436 MHz — High 434-436 MHz. Programming available to either Transmit/Receive both Low, both High, or a mixture of the two. Adjustable Drive Level is now provided by an input potentiometer. Optional RF VOX

Power Output 10 watts minimum ★ 28 MHz IF ★ Drive 1 mW to 500 mW ★ Aerial Changeover by PIN diode switch ★ Modern Microstrip Technology ★ Power requirements 12 volt nominal at 0 mA 2.5 amp. peak ★ Case size 187 x 120 x 53 mm ★ Spare 1/2 Input socket

**MODEL MMT432/28S — INTRODUCTORY PRICE: \$235.**

**MMT432 TRANSVERTER**

## New Release - 6 METRE MOSFET CONVERTER

FEATURES 24 MHz LOCAL OSCILLATOR OUTPUT FOR TRANSVERTER USE

Input Frequency 52.54 MHz  
IF Output Frequency 28-30 MHz  
Typical Gain 30 dB  
Noise Figure 2.6 dB

**MODEL MMC52/28LO — Price \$49.00**

2 METRE VERSION — WITH 116 MHz LOCAL OSCILLATOR OUTPUT FOR TRANSVERTER USE

**MODEL MMC144/28LO — Price \$49.00**

Typical image rejection: 65dB  
Crystal Oscillator Frequency 24 MHz  
Power requirements 12 volt ±  
25% at 35 mA.

## 500 MHZ COUNTER

### SPECIFICATION

**SPECIAL CLEARANCE of  
MODEL MMT432/28 TRANSVERTERS  
While they last — PRICE \$178**

### NEW READY-TO-OPERATE MODULES AVAILABLE IN THE SALES PROGRAM OF VHF COMMUNICATIONS

**1296 MHz CONVERTER** 144 MHz MOSFET CONVERTER  
Microstrip, Schottky diode mixer.  
IF - 28-30 MHz or 144-146 MHz.  
Noise figure typ. 3.8 dB  
Overall gain typ. 30 dB  
Overall gain typ. 30 dB. Price \$65

**432 MHz CONVERTER** 432 MHz MOSFET CONVERTER  
2 silicon pre-amplifier stages. MOS-FET mixer. All UHF circuits in microstrip technology.  
Noise figure typ. 3.8 dB  
Overall gain typ. 30 dB.  
IF - 28-30 MHz or 144-146 MHz. Price \$65

**VARACTOR TRIPLEX 432/1296 MHz**  
Max. input at 432 MHz 24 W (FM, CW) - 12 W (AM)  
Max. output at 1296 MHz 14 W  
Price \$74

Pack and Post \$1

All modules are enclosed in black cast-aluminium cases of 13 cm by 6 cm by 3 cm and are fitted with BNC connectors. Input and output impedance is 50 ohms. Completely professional technology, manufacture, and alignment. Extremely suitable for operation via OSCAR 7 or for normal VHF/UHF communications.

ALL PRICES SUBJECT TO CHANGE WITHOUT NOTICE

# GUIDELINES ON THE TEACHING OF MORSE CODE

The future of amateur radio depends upon the fresh influx of eager novices into the hobby, who are enthusiastic in their support of Morse code. The degree of enthusiasm expressed by novices towards the continuous wave means of communication depends upon the quality of instruction to which they have been exposed while mastering the skill. This article suggests a number of scientifically proven steps for the teaching of skills, and applies them to the learning of CW.

1. For the systematic development of skills, it is necessary to identify not only the specific skills to be taught, but also the activities which nurture them. Morse code should not be taught in an isolated context, separated from the rest of amateur radio. It must be seen as an essential and integral part of Amateur Radio. Amateurs with the best of equipment still find Morse useful today for communicating with foreign amateurs who are unable to speak English well, but who can write and send simple English. Furthermore, for amateurs with less effective antenna systems, CW makes possible readable DX contacts which are impossible by phone. CW for the beginner should be seen as a unique, exciting means of communication with distant amateurs who are inaccessible in any other way. Consequently, it is important that code practice take place as often as possible over the air, to offer the excitement, immediacy, realism, and meaning that goes with CW communications. Rather than listening to tapes, all learners should be encouraged to listen to DX CW contacts, as soon as possible.

2. An emphasis on the teaching of skills implies an emphasis on student-centred activity as opposed to teacher-centred explanation. The role of the amateur teacher is the structuring and timing of student practice and the actual transmission of Morse code. Only through regular listening to CW will the novice learn the skill.

3. Skills should be developed in connection with on-going activities and not in isolation. The actual content of Morse transmissions should always be aimed at improving the student's competence in passing the theoretical part of the amateur examination. Use of Q-codes, and simplified technical explanations of components and circuits over the air, provides suitable content for Morse transmissions.

4. Activities designed to promote the development of skills should be meaningful to the learner. It is important that the material being sent should be aimed at the level of the learner and be relevant to the amateur program.

5. Development of different skills should go on simultaneously. Students should be becoming familiar with the operation and characteristic sounds of SSB transceivers, by using such equipment as their instrument for learning Morse code. In this way, students not only learn the code, but also gain additional skill in distinguishing CW through QRM, QRN, and QSB. They become familiar with the sound of different transmitting "fists" Q-codes, amateur radio topics and talk, and with amateur and transmission characteristics of different parts of the world.

6. The development of skills calls for individualised forms of instruction. Combining students of different level abilities in Morse classes is harmful. It is important that the Morse being received by the beginner be within or near his capacity to understand. Code that is too slow is tedious, and CW that is too fast is frustrating.

7. Before instruction can begin, each student's standing in relation to the hierarchy of tasks involved in performing a particular skill has to be determined. The type of Morse being sent to the student must be suitable for his actual knowledge of the skill. This is particularly true for beginning students who have not yet mastered all the letters and numerals. The students' abilities may easily be determined by a pretest.

8. Provision of practice and feedback tailored to the individual performance of students is essential. The learning of Morse involves regular practice, preferably fifteen minutes a day, rather than longer periods at less frequent intervals. Short but regular practice times have been shown to increase learning speeds and enjoyment.

Students must always be provided with some knowledge of how they did following the lesson, and regardless of their results, should be enthusiastically and consistently encouraged and praised. Such positive reinforcement is essential for avoiding student frustration, anxiety, and despair. It's a useful technique to keep record of the learner's progress, either in the form of tapes of code speeds sent in the past, graphs of success rates, or simply a notebook of material copies each day. In this way the beginner may feel satisfaction and encouragement from a regular review of his performance. Direction is provided to the exercise. It is amazing, beneficial and encouraging for the student to discover how fast he is progressing, and how slow that Morse seems on a tape of a month past.

9. In teaching a new skill, the learner should first be made aware of the terminal objective. He should be aware of all the advantages and enjoyment accruing to

Donald E. Pugh VK6DN  
(formerly VE3HRA),  
c/o Christchurch Grammar School,  
Queensland Drive, Claremont, 6010

participants of the Amateur hobby, and with a syllabus of the examination requirements which he faces. Only if the student is converted to the thrill of DX seeking, and the enjoyment of "chewing the rag", will he be motivated to undertake the work required for the licence.

10. In teaching a new skill, the learner should be provided with a model of what constitutes adequate performance of the skill. Here, a tape with accurately timed Morse at five and ten words per minute is useful for the beginner to gauge his progress towards his goal.

11. In teaching of a new skill, the learner should be encouraged to attain the highest level of performance that his/her potential will permit. Successful students, upon passing their full ticket, should be encouraged to continue to build their speed. The extent to which forms students actually continue to use Morse provides a substantial benchmark for the measurement of the teacher's success in inducing enthusiasm for the skill.

12. In the teaching of a new skill, the learner should be provided with positive feedback telling the learner what he/she should do as well as negative feedback telling the learner what he/she should not do. Rather than criticize a beginner for mistakes, such as erratic sending, teachers should simply and quietly demonstrate the correct techniques.

13. Opportunities should constantly be sought for further practice of previously learned skills. In slow Morse transmissions, it is a poor idea to switch to phone in order to explain what has been sent. Reference to the source of the information sent should also be provided in Morse, and the total operation be completed in Morse. Not only is further practice provided, but more importantly, the emphasis is upon Morse as a practical communications mode, not supplementary, but equal to and self-sufficient from phone.

14. In teaching a new skill, allowances should be made for a wide range of performance of the skill. Not all students will emerge as good CW operators. This must be recognized and tolerated.

15. In the teaching of a new skill, the level of difficulty should be increased as mastery is achieved. It is useful to keep Morse difficulty always slightly beyond the ability of the receiver. Morse that is being copied at one hundred per cent is slightly slow for practice purposes.

16. In teaching a new skill, the learner should be introduced to its component subskills one step at a time and in a sequence representing levels of difficulty. The ARRL publishes a useful handbook on the learning of Morse code, and undertakes a task analysis of the alphabet by grouping letters and words of various dif-

culties. This hierarchy of the alphabet in terms of difficulty is an invaluable aid in initially learning CW and the handbook is suggested as a necessary teaching aid.

These suggestions concerning the learn-

ing of Morse have been successfully shown to be valuable in learning all skills. They offer useful guidelines for amateurs embarked upon the rewarding experience of sharing their expertise with others. The

implementation of these guidelines promises to ensure the successful arrival of enthusiastic novices who support and enjoy CW as a viable and relaxing communications mode.

## "VK" - "CB" WEEKEND SEMINAR

The first seminar between CB and Amateur radio operators was held on the Queen's Birthday long weekend of the 11th, 12th and 13th June at Hillend. The seminar, entitled "An introduction to the hobby of radio transmitting", was organised by the 4-Wheel Drive Radio Club of N.S.W. (4WD). The seminar was especially designed to firstly provide a whole range of information to those living in the country areas, secondly to bring amateurs and CB operators together in such a co-operative project, and thirdly to provide the basis for the development of friendship between CB-ers and Amateur, city and country. At the seminar, members of the Orange CB Club and the Bathurst CB Club joined with Sydney CB-ers and radio amateurs in discussions ranging from radio procedure, regulations, operating and maintaining equipment and aerials, as well as operating on the 160, 80, 40, 20, 15, 11, 10 and 2 metre amateur bands under the instruction of Sam VK2BVS.

All the aims of this project were realised and the 4WD Club has decided to organise more regular similar seminars between CB-ers and Amateurs.

At the June seminar David Wilson VK2ZCA, from the Youth Radio Educational Service, gave an outline of the new 15 lesson novice hobby transmitting licence course which has since been undertaken at several CB clubs in N.S.W.

The seminar was in the form of a field camping trip with portable generators providing power. Some 50 people attended, ranging from 12 to 70. The BX (Bathurst)

Members of the Orange and Bathurst CB Clubs learning the art of home-making helical antennas.

CB Club helped enormously, thanks to the organisation of their President.

### RADIO EQUIPMENT NETWORK

On Saturday evening, following the crash of a Suzuki bike between Sofala and Hillend, a link between the crash site and Hillend was set up on 11 metres by CB-ers, who passed information on to amateurs who operated a 2 metre link into Orange. The amateur at Orange contacted the Bathurst Hospital where preparations were in progress to receive the accident victim.

## A Dx-er's BOAST I've Worked Everywhere"

Alan Shawsmith VK4SS.

(Short Parody of Lucky Starr's "I've been everywhere" — to be read rapidly)

I've worked 'em everywhere —

Kumaran, Sudan, Vatican, Cayman, Afghanistan, Pakistan, Yucatan, Isle of Man,

Beast that I you can.

Liberia, Sardinia, Zambia, Nigeria, Bolivia, Colombia, Liberia, Siberia — and other places rare and earlier.

Aland, Iceland, Greenland, Finland, Poland, Thailand, Holland, Newfoundland.

Yeah, I swing the beam around.

Highville, Brazzaville, Amityville, Townsville, Hicksville, Libreville, Abbaville, Hamsville — and ever other ville and hill.

Sicily, Niamey, Hungary, Enderbury, Italy, Orkney, Calgary, Canterbury.

Yes sir, I've been busy — very.

Trenton, Gordon, Nelson, Boston, Canton, Brandon, Saigon, Houston. Never miss, I spot on.

Pusan, Japan, Iran, Bhutan, Surinam, Jordan, Azerbaijan.

Yep, I've wkd 'em all man.

Shanghai, Brunei, Hawaii, Haile, Burundi, Aloft, Hanol, Tbilisi.

Nothing's passed ME by.

Pagoda, Samoa, Elmdorfer, Balboa, Bogota, Angola, Andorre, Lieboea.

Oh yes and throw in Goa.

From the oldies to the new, From Samarkand to Timbuktoo.

I've worked 'em all, it's true.

Hullo, who's that calling me? This is Sikkim calling — AC3.

Boy, I sure want an AC3.

But you've wkd everywhere man. So you can't need me, 73.

## QSP

### COMPONENTS

The Victorian Division Council has decided to terminate component trading as of 31st December 1977. It is recommended that before you order to send your orders in now as many lines will not be replaced when stocks run out. No more credit notes will be issued. Holders of credit notes are requested to order components to the value of their credit.

### UK REPEATERS

"We just cannot understand why the small group which gets its kicks from deliberately interfering with repeaters, cannot leave them alone and find some constructive thing to do. Surely the HF/UHF bands are wide enough to permit all types of operation". From *Mobile News* June '77.

### MEMBER'S NEWS

If you have had an amateur licence for 25 years or more you are eligible for membership of the Radio Amateurs Old Timers Club now active in all States. If you would like to become a member contact Harry Cliff VK3HC, Max Hull VK3ZS, Stan Dixon VK3TE, Snow Campbell VK3MR, the founder, Bob Cunningham VK3ML, or any existing member of the Club for details of certificate, etc.

### SCOUT NETS

Australian Scout Radio Net first Sunday, each month 7000 kHz 0930-1100 h EAST or 14200 kHz 1100-1300 h EAST. All frequencies plus minor QRM. Also South Australian Scout net first and third Thursdays 3900 kHz from about 1930 h to 2000 h local SA time.

### WATERFALL 11

Amateurs who wish to remain on 11 metres by obtaining a CB licence are invited to join the VK CB Club. The aim of the Club is to assist the citizens of the VK band CB stations who are assisting CBers who would study to take the amateur amateur licence. Membership to the VK CB club is open to all amateurs, all those studying for an amateur licence and all those who wish to one day become radio amateurs. The VK CB club will work with all other CB clubs and will reflect a spirit of the amateurs' contribution to the development of the Citizens Radio Service.

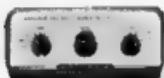

For more information on the VK CB Club write to Sam Voron VK2BVS, 2 Griffith Avenue, East Roseville, 2068; and enclose a self-addressed stamped envelope to assist in a speedy reply.

## AFTERTHOUGHTS

Our resident gremlin has struck again! Greg Brown's article "A Solid State Video Modulation System", AR July 1977, has an error in Fig. 2 as published. A 6.8 k ohm resistor is shown on the input of the MPS 6514 with one end connected to the +12 volt coil. This end should connect to the collector of the MPS 6514. The other end remains connected to the 5.6 k ohm resistor, 25 mF and 1000 pF capacitors.

TOKYO HY-POWER LABS.

# "Hy-Power" Universal Antenna Couplers

PRICE HC-75 \$54  
HC-500 \$112  
HC-500A \$119  
HC-2500 \$246

If you're fighting a constant battle of limited band width, high SWR causing low power output from your Solid State transmitter, poor efficiency from a mismatched Low Pass Filter, then step up to an antenna coupler from Tokyo Hy-Power Labs HC series.

Basically identical except for power handling capabilities, the HC 75, HC 500, HC 500A and HC 2500 use the well tried and proven "transmatch" circuit. High quality components are used throughout such as large variable capacitors with steatite supports, and high RF voltage rated rotary switches.

The HC series of couplers will match a 10-600 ohm impedance (even higher if load is purely resistive) into 50 and 75 ohms. Multi band operation is possible with a 5 to 20 metre long single wire antenna. Second harmonic attenuation of up to 30 dB can be realized. Receiving advantages include improved cross modulation characteristics due to band pass effect of the coupler. Improved signal to noise ratio due to correct front end matching. These high quality HC series antenna couplers are available from Bail Electronic Services.

# RECOGNITION FOR JA OPERATOR

Some time ago in AR, reference was made to a rather special amateur station in Japan.

This is JH6THP, operator Chitary, who is incapacitated and operates his station from his bed in the National Hospital at Kawatana, near Nagasaki in Southern Japan. Chitary, who is very active and very well known by VK stations on the 15 m band, speaks excellent English learned by himself from books — no mean achievement. He currently teaches school students English language in his spare time.

Chitary, during recent years of operating on 15 metre band, has made numerous firm friends in many countries, including Australia, New Zealand, U.S.A., Canada, Philippines, Papua New Guinea, etc.

Recently he initiated a scheme to form a "Pacific Amateur Radio Society" (PARS), to include amateur radio stations in countries bordering the Pacific Ocean. The Society has Chitary as its inaugural President and is currently registering members. Numerous stations have joined to date and the Society is now functioning. Shortly, the first PARS publication will be released to members by mail. A "net" is operated on 15 metres and members "check in" regularly when conditions permit.

Recently a letter was received by Chitary from the Australian Ambassador to Japan acknowledging his work in Amateur Radio towards the development of friendly relations between Australia and Japan (see letter).

This letter is a great source of pride to Chitary and is of immense value to him — particularly as he is confined to bed and cannot engage in normal activity. It is gratifying to realise that governments are able to see, and recognise, people who are devoting time and effort towards better understanding between nations — surely something desperately needed in today's troubled world.

Parliament House,  
Canberra, A.C.T. 2600

Minister for Post and Telecommunications,  
and

Minister assisting the Treasurer

Mr Chitary Moriyama,  
Room 11, DMP Ward,  
Kawatana National Hospital,  
2005-1 Ohaza Shimogumigou,  
Kawatana-cho Higashi Sonogi-gun,  
Nagasaki 859-36

Dear Mr Moriyama,

The Australian Ambassador to Japan, His Excellency, Mr. K. C. O. Shann, C.B.E., has recently written to me regarding your achievements in the field of amateur radio.

Des Greenham VK3CO,  
23 Stewart Street, Seymour, 3660

Chitary — JH6THP

As the responsibilities of my Ministry include the administration of the radio frequency spectrum in Australia I have a particular interest in radio activities. I was particularly impressed to hear from Mr. Shann of the activities of the amateur radio club, that you and some of your fellow patients have formed at the Kawatana National Hospital, Nagasaki. I understand that you are the President of the Club and that in addition to this, you have also established your own amateur station in your room at the Hospital.

I would like to take this opportunity of commending you on all you have achieved, particularly when these achievements have been made in the face of such a severe personal handicap.

As you are aware, amateur radio is a wonderful medium. I cannot, however, think of the radio art being used in a more beneficial manner than the way in which you and your friends are employing it. The establishment of contacts with people in other parts of the world fosters international goodwill and friendship and I believe that through your efforts, you are contributing in no small way to a greater understanding between the various peoples of the world.

Once again please allow me to convey to you on behalf of both myself, and my Department, warmest congratulations on all you have achieved and best wishes for your future attainments in amateur radio.

Yours sincerely,  
(Signed) ERIC L. ROBINSON.

AN AR SPECIAL:

# REVIEW OF THE MULTI 2700 TRANSCEIVER

New equipment for the two metre amateur seems to be never ending. Further, it appears that technical innovations are appearing more often with this section of amateur gear than perhaps for all other types. The subject of this review is the Multi-2700 transceiver. In a nutshell we have a rig with 144 to 148 MHz coverage on FM, SSB, CW, and AM. Two different methods are provided to cover this range, firstly with a switch selected synthesizer in ten kilohertz steps with a VFO to allow operation between these points. Then secondly a normal VFO with continuous coverage of the range in four, one megahertz, steps. All the usual facilities such as noise blanker, VOX, repeater offset, speech compression, S meter and centre zero discriminator meter are there. And there is even more. Included in the package is a ten metre converter to allow operation through OSCAR. It is hard at this time to think up any addition that needs inclusion.

However, back to the beginning. The Multi-2700, which is a product of the Fukuyama Co. of Tokyo, is imported into Australia by Sideband Electronics Imports of Springwood, N.S.W. For the present time these rigs will only be available on order, and it is not anticipated that they will be a stock item. For this reason our review will not be quite as lengthy as usual. We will, however, present a description and performance summary which will enable any interested amateur to decide whether this rig is for him or not.

The Fukuyama Co. is of course well known in Australia with its "MULTI" products and the MULTI 7 was the subject of a review in this magazine some time ago. The MULTI 2700 is actually an adaptation of the MULTI 2000, which was possibly the very first of the multi-mode two metre transceivers available on the Australian market. For those readers interested a review of this transceiver appeared in CQ magazine for January 1976. For some reason the Multi 2000 was not a great success on the Australian market, perhaps because of the lack of a normal continuous tuning arrangement. It seems that this might have been the reason for the Fukuyama Co. to add this to the 2000, making the 2700. However, as well as the VFO, other changes have been incorporated to set this rig apart from most of the other multi-mode transceivers on the market. The synthesized section now has a full LED digital readout, while the VFO section has a very smooth and clearly illuminated dial. The one megahertz steps are indicated by illuminated signs above the VFO dial scale.

In use it was found to be a very convenient system. The synthesized section with the digital readout could be set up on the FM portion of the band and easily switched from one channel to another while

The FDK Multi 2700

Photo: Reg Goudy

the VFO could be set up for SSB operation. There is no doubt that this overcomes one of the problems with the fully tuneable two metre transceivers, that is, accurately setting up the dial for each of the required FM channels. The built-in speech compressor is most effective and with weak signals makes the difference between the signal being readable or not. In appearance the MULTI-2700 is unusual. It has a somewhat wide, low look, with the VFO section looking rather tucked on. The dimensions are 128 mm high, 378 mm wide, and 305 mm deep, and the weight is 14 kg. The transceiver is entirely self-contained with built-in AC power supply and loud speaker. Operation from twelve volts DC is also provided by changing the power cord. In appearance the 2700 has a somewhat "plastic" look. Whilst no doubt attractive overall, it would be very much a matter of opinion whether you would consider it professional. The meters and dial scale are illuminated in vivid green, the LED readout in red, and with red and green indicator light.

## THE MULTI 2700 ON TEST

We submitted the 2700 to our normal series of tests. In general it exceeded the published specifications by quite a wide margin.

Power output was first checked with the rig in the high power position.

144 MHz 16 watts; 145 MHz 18 watts; 146 MHz 18 watts; 147 MHz 16 watts; 147.99 MHz 14 watts.

The power output at 148 MHz exactly had dropped to 6 watts. These figures greatly exceed the published output of ten watts.

On SSB, the PEP output was 144 MHz 14 watts; 145 MHz 16 watts; 146 MHz 16.5 watts; 147 MHz 16 watts; 147.9 MHz 14 watts.

Transmitted audio quality was judged to be well balanced and clean on SSB but somewhat bassy on FM.

The receiver section was next tested. Three degrees of selectivity are provided. The mode switch allows either wide or narrow FM reception, while on SSB, AM and CW a common 2.4 kHz bandwidth is provided. The FM bandwidth was checked at a receiver input of .5 mV. The narrow position would handle 5 kHz deviation with low distortion and the wide, 7 kHz. Increasing either of these by only one kilohertz produced noticeable distortion. With stronger signal input the receiver would handle somewhat higher amounts of deviation, but it proved beyond doubt that deviation must be kept down for weak signal reception.

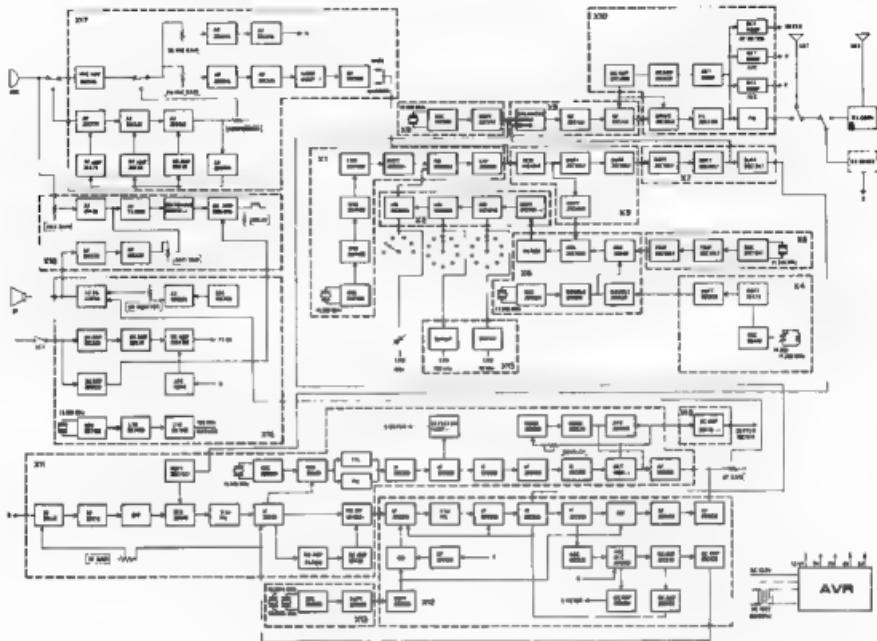

Next the receiver was checked for sensitivity.

FM reception. The mute opened .2 uV.

At 5 uV 18 dB quieting was produced and at 1.0 uV the figure was 24 dB. On SSB, the signal to noise ratio was 15 dB at .2 uV and 23 dB at 5 uV. The calibration of the "S" meter was checked.

| "S" Reading | SSB     | FM      |
|-------------|---------|---------|
| 1           | .35 uV  | .7 uV   |
| 2           | .4 uV   | .9 uV   |
| 3           | .5 uV   | 1.7 uV  |
| 5           | .55 uV  | 2.1 uV  |
| 7           | .7 uV   | 2.5 uV  |
| 9           | 1.9 uV  | 3.5 uV  |
| 9 + 20      | 5.0 uV  | 8.0 uV  |
| 9 + 40      | 45.0 uV | 30.0 uV |

From this it can be seen that S meter readings are somewhat generous but as it is normal to work with very weak signals on VHF they are probably useful in relation to the average signal encountered. The accuracy of the synthesizer was checked and it was found to be 400 Hz high. The 600 kHz offset was within 100

BLOCK DIAGRAM

Hz in relation to the above error. The transmitter deviation on FM was checked and found to be 4 kHz in the narrow position and 9 kHz in the wide. It should be noted that the speech compressor only works on SSB.

The ten metre OSCAR converter was checked for sensitivity and found to be 0.5 uV for 9 dB signal-to-noise ratio and 1 uV for 15 dB.

The VFO dial calibration and linearity were excellent. Over the full one megahertz calibration was within  $\pm 1$  kHz. Stability was likewise good with less than 1 kHz shift over a one hour period from initial switch on.

The MULTI 2700 proved to be a delight to operate. With the synthesizer set up on a favourite FM channel, it was possible to go from FM to SSB with a click of the mode and selector switch. A very handy facility. It is, of course, possible to reverse the functions and operate SSB with the synthesizer and FM with the VFO, but there is no repeated offset facility with the VFO. Only simplex operation is possible.

Unfortunately we were unable to check the OSCAR capabilities of the 2700 while on test as a suitable antenna was not available.

The VFO tuning dial had a two speed

drive which proved to be exceptionally smooth to operate. A receiver offset control is provided.

The instruction book is well written and comprehensive but, as is usual these days, makes little mention of servicing. The trouble shooting page covers mostly operational errors. However, a large and clear schematic diagram is included.

As mentioned earlier, these sets are not available ex stock at the present time. Information on price and delivery can be obtained from the importer, Sideband Electronics Imports, P.O. Box 23, Springwood, N.S.W., from whom the review sample was obtained. ■

## C.A.R.E. (COMMUNITY AMATEUR RADIO EVENTS)

### ALERT AMATEURS HELP APPREHEND CAR THIEVES

Early on Sunday morning (around 4.00 a.m.), 24-7-77, Jim VK3ZOS, who was mobile in Springvale Road, Keysborough, sighted a vehicle parked on the median strip with a broken side window. As he slowed for closer examination, the vehicle was driven off at high speed. It was apparent that the car was stolen.

Jim was able to follow the stolen car and relay details through the Ch. 2 repeater, VK3RML, to Garry VK3ZSP, who contacted the Melbourne police by phone.

By keeping the phone line open, Jim and Garry were able to relay messages to the police radio room (D24), who in turn directed patrol cars to the area.

A merry chase lasting 15 minutes ensued.

The efforts of Jim and Garry enabled the police to apprehend the offenders without violence or injury.

Just another small anecdote showing the virtues of amateur radio giving assistance to the community.

(Contributions to this column are solicited.—Ed.) ■

# WIA CORRESPONDENCE

8th August, 1977.

Secretary,  
Postal & Telecommunications Dept.,  
G P O Box 5412 CC,  
MELBOURNE 3001.

Dear Sir,  
This Institute, representing the amateur service in Australia, wishes to express concern about a wide range of largely inter-related developments affecting the service.

Of first importance are those matters which stem from the staff shortages within the Regulatory and Licensing Branch as exemplified in paragraphs 53 to 58 of the Report on the Introduction of a Citizen Band Radio Service to Australia and further illustrated by the low priority accorded to amateur service affairs.

The Institute observes that somewhat similar situations have manifested themselves in the United States of America and the United Kingdom. In these countries certain measures have been taken, in acceptance of the fact that the amateur service is largely self-regulating, to abolish a number of restrictions which created an unnecessary loading on the licensing and regulatory workforce.

In various submissions to Government in recent times the Institute has emphasized that the work being done by Departmental officers is of a high standard but, in the light of re-organizations and reduced numerical strength, further assistance is vitally necessary—

- (a) To streamline and to reduce to a minimum the various procedures and systems presently in force;
- (b) To investigate every possible avenue of assistance in carrying out certain specified duties; and
- (c) To strengthen, as quickly as possible, the processes of law and order relating to frequency spectrum usage.

Having regard to the manner in which CB legislation was engineered, a not un-substantial number of radio amateurs not only anticipate the permanent loss of the 11 m band to the amateur service in Australia, but are most apprehensive about the eventual fate of certain other amateur service bands. The Institute, however, does not necessarily subscribe to these views since it must believe that the Government will adhere to the present intentions and will take such steps as are necessary to contain the situation within existing parameters.

Unfortunately, the lack of urgently required measures to control the sale and/or importation of transceivers designed for use in the part of the spectrum, coupled with almost non-existent spectrum management police action against illegal operators, lends support to those who lack confidence in the bona fide intentions of the Government in this technical field.

This Institute trusts that wiser councils will prevail and therefore asks for reassurance that appropriate measures are to be taken before it is too late. It is not possible to believe that the Government willingly desires to place in jeopardy the credibility of Australia in international radio communications circles built up over so many years. Furthermore, the Minister ought to be reminded at every opportunity of the chaotic conditions surrounding illegal operations in the U.S.A. and how these cannot fail to be taken into account unfavourably at the WARC 79 deliberations.

As will be observed, this Institute wishes to place on record in the strongest possible terms condemnation of illegal operators of transmitting equipment. This has been made clear on numerous occasions in the past. The Institute recommends that the detection and conviction of illegal operators is of paramount importance. Measures to strengthen the forces of law and order must be taken and at the same time every effort ought to be made in every other direction to reduce the work load to achieve this objective.

Consequently, this Institute wishes to propose a number of changes relating to amateur radio licensing and procedures. These are detailed in Appendix A to this memorandum.

The Institute has for some time been disturbed about the low priority accorded to amateur radio affairs in the Department. However, when this low priority rating becomes more evident as exemplified by the very lengthy waiting time experienced by successful examination candidates obtaining their amateur licences, it is of no comfort to the applicants (a) that CB licences can be obtained almost "over the counter" and (b) that the normal delay time for amateur licences was three weeks. The waiting time is now of the order of six months in some States and lengthening.

Some improvements in the examinations area have been welcomed, namely: multiple choice questions and answers (although others, not of an essay type, should not be ignored), quick marking of these kind of papers and announcement of results within a reasonable time. Nevertheless, it is believed that some scope for further improvements exist. Firstly, it is recommended that candidates sitting for amateur examinations should be presumed to apply for an appropriate licence if they pass. If this fact is recognised and accepted it is suggested that an integrated series of forms should be completed by the candidate at the time of the examination so as to reduce the amount of clerical work involved in—

- (a) Advising pass/failure,
- (b) Issuing a certificate (where appropriate),
- (c) Issuing an appropriate licence.

Secondly, the Institute wishes to assist with some or all of the examinations if an independent Education Authority cannot be found to take these over from the

Department (cf. City and Guilds Institute for the U.K.). The problems which arise may be listed as—

- (a) Infrequency of exams (twice yearly for each),
- (b) inability to examine candidates in many centres of some importance (Launceston, Warrnambool, Kalgoorlie, etc.), necessitating considerable travel and time off for those country area candidates, many of whom can ill afford either or both
- (c) Some overcrowding in the main centres

A set of proposals is attached hereto as Appendix B. It should perhaps be pointed out that, so far, there should be little, if any, repercussions internationally in relation to Novice Licensing since no reciprocal licensing arrangements appear to have been announced for this class of licensee. It is accepted that the standards and methods of conducting examinations should receive some recognition for reciprocity of licensing. Nevertheless, the number of amateurs requiring reciprocal licences during the validity of their licence is comparatively small. It should also be pointed out that amateur licence examinations in several countries overseas are conducted by the amateur radio society itself (e.g., Indonesia) or some other body. The fact that no international opposition appears to have been voiced reinforces the Institute's submission that Radio Regulation 158A is capable of liberal interpretation. It is not necessary therefore to follow British practices and traditions to the letter.

Yours faithfully,

P. B. DODD,  
Secretary.

## APPENDIX A

This is divided into two parts. Part A relates to matters still before the Department, having been submitted in correspondence dating back to 1976 and earlier. Part B relates to other matters.

### PART A

- (1) Third Party Traffic of a restricted kind namey
- (a) A revision of paragraph 94 of the Handbook to permit emergency traffic to be handled as an automatic dispensation by amateur VHF/C stations called in or being used for communications concerning an emergency or involved in properly constituted practice nets.
- (b) A revision of paragraph 92(a) of the Handbook to call for common practices in the amateur service such as passing net traffic lists to establish proper net control.
- (c) The items (a) and (b) might be swapped if third party traffic is granted to the amateur service as proposed in letter dated 27/8/77.
- (d) Official broadcasts by the WIA should be permitted at any time and on any frequency.
- (2) Beacons (attended and unattended) should be licensed for operation in any part of any amateur band subject to compliance with WIA frequency plans.

- (3) Use of telephony by limited licensees should be permitted.

- (4) Station identification cards should be extended to 10 minutes instead of the present 5 minutes (U.S.A. allows 10 minutes, UK allows 15 minutes).

- (5) Amateur stations should be granted no less assistance in relation to interference problems than is afforded to other services and in particular—

- (e) should expect collaboration in obtaining more stringent measures to be taken by manufacturers to reduce the susceptibility of commercial equipment to radio frequency emissions;
- (b) should expect that commercial broadcasting stations be moved to parts of the spectrum where their operations are likely to cause less interference to stations in other services and vice versa (TV Channels 6 and 8A are the serious offenders in this respect);
- (c) should expect that suitable standards be adopted and policed to reduce interference caused by electrical appliances and equipment of all kinds; and
- (d) should expect that radio alarms and other non-specified radio devices should not operate within amateur bands.

(6) Reduction in licence fees for pensioners and disabled persons: Promised in letter RBA/4/32 of 19/10/76 but not yet implemented.

(7) Identification by RTTY stations — revision of paragraph 112 promised in telex RBA/11/35 of 8/12/76.

(8) Repeater conditions: Various matters still require liberalisation, namely:

(a) Since the WIA has published band plans for repeaters in order to avoid chaos, it has previously been submitted that no repeater licence should be issued by the Department unless prior agreement is given by the WIA in relation to the frequency it is proposed to authorise.

(b) The insistence that repeaters should be provided with manual on-site shut down switches cannot be met whilst the Department still requires that proper security measures must be provided for the installation as a whole. There are other methods acceptable to the amateur service, of closing down repeaters when so required by the Department which necessitate very little time and effort on the part of repeater staff.

(c) The number of amateur service repeaters should not concern the Department as this is a matter for the service itself to resolve.

(d) Repeaters should be permitted on all amateur bands from 144 MHz upwards; i.e., however, frequencies are selected on shared bands which could cause interference to the primary service the WIA should be advised (if need be on a confidential basis) accordingly and given options of other channels which are clear.

(e) Various other conditions should be liberalised as requested — letter of 30/7/1976 refers.

(9) The Institute is disturbed to observe that in some States Amateur Advisory Committees are inoperative. These are considered to be a valuable service and the alleged lack of funds to pay overtime for the official staff should be reversed. In addition a review of the work of these Committees has been under discussion with the Department for several years but nothing has been initiated to this end.

(10) Applications have been made over a long period of time for additional frequencies. The Institute agrees that these might usefully be discussed in the context of WARC 79.

(11) It has been suggested that the period of validity of amateur licences should be extended from one year to three years to economise on renewals. Paragraph 28 of the Handbook refers.

(12) Examination matters appear in Appendix B.

## PART II

(1) Third Party Traffic: Relaxations similar to those in force in the U.S.A. have been requested in a letter dated 27/6/1977.

(2) Portable and mobile operations. Paragraphs 90 to 93 of the Handbook impose additional work on the Department without, it is submitted, conferring any positive benefit providing the Department retains upon all amateurs advising changes of addresses. The days when mobile operations were comparatively rare events have long gone — many amateurs today operate mobile from their vehicle as a matter of daily routine. Paragraph 92 could be retained. In the light of these proposals paragraphs 87 to 89 and 38 should be revised and liberalised very considerably.

(3) The mandatory requirement to keep a log book paragraphs 85 and 86 in the Handbook — should be modified to become a voluntary requirement.

(4) Paragraph 84 of the Handbook should be modified in relation to radio amateur to exclude communications transmitted or received directly concerning amateur service matters. In this context it is pointed out that a radio amateur conveys the secrecy provisions. If he reports on pirates or intruders.

(5) It is submitted that a common meaning frequency-segment should be authorised where all classes of amateur licences may communicate one with another. The Institute would wish to make further submissions in this regard at a future date.

(6) The requirement that amateurs should obtain permits to conduct television experiments should be abolished.

(7) Novice licences should be permitted to use variable frequency transmitters.

(8) Any amateur, upon application, should be granted "Citizens band" licences free of charge.

## PART III

1. Detailed examination syllabuses are considered to be essential. A Novice theory examination syllabus has been submitted by the WIA to the Department but not yet approved.

2. Four examinations of each class should be held every year.

3. More examination centres should be provided.

4. The adoption of "multi-choice" and similar techniques should be universally adopted for theory and regulations examinations. The pass mark should be reduced from 70 per cent to 55 per cent. Any cardholder obtaining more than 50 per cent but less than 55 per cent marks in the theory paper should automatically qualify as having passed the Novice theory examination.

5. The identification of examination candidates should include the provision of a signed passport-type photograph returnable on request if a failure results.

6. The results of examinations and the availability of licences should not be delayed beyond three (or at the most, four) weeks after the date of the examination.

7. Lists of successful cardholders (or copies of licences issued) should be made available to the WIA within one month.

8. General comments by the examiners about the failure rates and possible reasons why they occurred should be issued after each set of examinations.

9. Morse code examinations should be given at speeds other than 5 and 10 w.p.m. and endorsement or "stickers" be made available to successful candidates on application.

10. The spacing lengths between letters should be modified from strict compliance with the ITU standard; submissions on this aspect have already been made but no results are known.

11. The Institute believes, and has stated, that its assistance should be sought on —

(a) Invigilation of some or all examinations by responsible licensed amateurs.

(b) Some of the examinations, especially the Morse code tests and Novice theory parts, should be conducted by responsible amateurs under controlled conditions which will now be set out hereunder for consideration:

### (i) Morse Code examinations:

(a) Novice: Should be set, taken and recorded by any full call licensed amateur approved for the purpose by the WIA Divisional Council concerned. Exam may be held at any time and place mutually satisfactory to all parties.

Examination general instructions to be provided by the Department.

Result of exam to be recorded on a special form designed to serve all purposes (advice to candidate, report to Department).

(b) Other: WIA Division concerned to submit to Department a panel of members recommended to hold these exams;

Department to approve names. Exams at 10, 12 or more w.p.m. may be held at any time and place mutually satisfactory to all parties.

Examination general instructions to be provided by the Department.

Exam to be held in the presence of a witness approved by WIA. It is considered necessary that record of proceedings if controlled as essential.

Results to be recorded on a special form as for Novice exams.

Department to hold one more exam each year for speeds over 10 w.p.m. for any amateur wishing to qualify for the issue of an internationally recognised Novice certificate — I considered necessary.

(NOTE: Automobile Associations overseas issue an International Driver's Licence to any member holding such a document and this is officially recognised Internationally — similar principle is therefore known in other spheres.)

### (ii) Theory examination:

(a) Novice: Department to approve a "bank" of multi-choice (and similar mode) questions for the Novice exam in accordance with an agreed syllabus. Questions might usefully be grouped under such section headings as "Interference", "amateur", "receivers", etc.

Answers key to be held by a Divisional Education Officer appointed by each Div in who should attend all exams if possible.

Divisional Councils to nominate responsible amateurs for purposes of holding exams and names to be submitted to Department for approval. Exams to be held at any time and place mutually convenient to all parties. Department to issue general instructions about such exams. Time and place of exam to be notified one week in advance to local Divisional Education Officer.

Unless otherwise instructed by the Department 15 questions to be put to candidates including at least one question or from each section. Allow two minutes to answer each question.

At conclusion of this part the exam paper to ask one general question for cardholders to answer from a pre-arranged set (e.g., simple circuit diagram, write out a simple formula, draw diagram to illustrate skip etc).

Collect and where possible mark the papers there and then and issue special integrated form with copies for all concerned. [If] Divisional Education Officer unable to attend he can supply the examiner with an answer sheet key in a sealed envelope to be opened by the examiner in the presence of the cardholders at the conclusion of the exam and the fact authenticated by signature on the sealed envelope for return to the Civilian Education Officer.)

(b) Other: It is recommended that responsible radio amateur Invigilators should be appointed. Nomination of specific persons could be by the Div in concern with names being submitted to the Department. These Invigilators would be for country areas at some distance from present examination centres. The person to whom the appointment sends to the Invigilator a sealed envelope containing the exam papers. If no candidates attend, the sealed envelope is returned intact in an enclosed stamped envelope supplied by the Department. If candidates attend the Invigilator complies with printed instructions, opens envelope in presence of candidates and obtains their signatures certifying this was done in their presence.

(iii) Regulations examination:  
Same principles as for Theory (b).

**NOTE: Theory and Regulations exams** - It is recommended that, with the assistance of the WIA, the Department should produce a "bank" of questions to enable examination papers for individual examinations to be prepared quickly at small cost. It is suggested that the general question "bank" should be used to produce 75 per cent of each individual examination paper. The remaining 25 per cent of questions can derive either from a separate "bank" or be prepared on an ad hoc basis for each exam. If this suggestion is followed and if answer overlays are used for answer papers keyed one with the other a very quick rate of marking can be achieved. If an integrated application form is also introduced it is suggested that -

- (a) Licensing delays can be minimised, and
- (b) At least four examinations of each kind should be within the capabilities of the Department each year.

## IARU NEWS

Six new members have been accepted into the IARU. These are the amateur radio societies of Sierra Leone, Bahrain, Bulgaria, Turkey, Papua New Guinea and Jordan. The grand total is now close to the 100 mark. But remember, there are 183 members of the ITU.

The SARL received a letter from their PMG stating that their broadcasting services had requested the deletion of the footnote (No. 212) relating to the allocation of 7120-7150 kHz to the amateur service in South Africa and South-West Africa. This was quoted in Radio ZS for May 1977.

Incidentally, what is WARC 79? A little background information would assist in an understanding of it.

The frequency spectrum is a limited resource. There is just so much of it, no more.

Very early in the history of radio communications the fact could be recognized. Without some kind of co-ordination the control chaos would soon have developed if every country did as it pleased with frequency allocations in the useful part of it them known, namely, the HF frequencies as we know them today. The radio signals were, and are, no respecters of frontiers.

The International Radiotelegraph Union was formed in 1906. This was merged in 1932 with the International Telegraph Union, formed in 1865, to become the International Telecommunications Union, abbreviated to ITU, formally established in 1934.

The ITU was set up as a technical arm of the United Nations organisation and hence forms a part of it. ITU headquarters is in Geneva and its membership are the sovereign countries of the world desirous of joining it and providing subscriptions to run it. The present membership totals 153.

The ITU's principal officer is the Secretary-General controlling a large office costing around \$10 million per annum.

The affairs of the ITU are governed by a Plenipotentiary Conference, Administrative Conferences and, of course, the Secretariat. It controls the International Frequency Registration Board (IFRB) and two main consultative technical committees, one for radio and the other for telegraphs and telephones.

The member countries, which includes Australia, New Zealand, Papua New Guinea and so on, all meet in the regular Plenipotentiary Conferences held at various times for various purposes such as Broadcasting, Maritime, Space and Aeronautical. There is also a main Administrative Conference, known as the World Administrative Radio Conference General, held about once every 20 years. This is the one in which radio amateurs have a main interest. The last WARC General was in 1959 and the next is in 1979, which is abbreviated WARC 79.

The WARC General works to an agenda which up till now included almost everything dealing with radio communications—definitions, frequency allocation tables, radio regulations and general operating codes.

The delegations at a WARC General, from the member countries, will be augmented by observers from many other organisations, including the International Amateur Radio Union (IARU) in addition to its ITU Secretariat staff.

Because of the enormous complexities involved, the work of the Conference is broken down into numerous working groups which in turn appoint sub-groups as required. All the working delegations in the various working groups—all of which work simultaneously—goes forward into the Plenary sessions. From the latter derive the agreements which may or may not be ratified by all the member countries. Some may ratify with reservations and numerous footnotes could be devised as varying the agreed frequency tables.

It can be seen therefore that the larger countries of the world must send big delegations so that they will be sure of being able to keep track of the work being done in all the groups.

Such a WARC General as WARC 79, scheduled to last 10 weeks in Geneva, will attract a thousand people or more. Before the Conference a vast range of technical material will be prepared by the consultative technical committees. Amateurs are, of course, interested in the radio committee, which is the CCIR, an abbreviation of its full name French. The work of the CCIR is carried on all through the years by technical experts appointed by member countries. Australia is represented by the CCIR, and as far as WARC's work is concerned, the RWA is responsible.

The work done by CCIR assists the work of WARC's, although it would not necessarily take precedence over other matters since it is purely technical. The ultimate decisions could possibly derive partially from political or other considerations. These eventually come out as Radio Regulations operative a year or two later.

There is therefore a very wide gulf between what each country originally prepares as a brief for the Conference and the end results. Each country must prepare such a brief for its WARC 79 delegation, and the WIA, with the help of the IARU, are presently involved in the preparations for the Australian brief.

## AWARDS COLUMN

Brian Austin, VK5CA

P O Box 7A Crafers SA, 5162

### WORKED YUDXC MEMBERS (WYUDXCM)

This award is issued by the Yugoslav OK Club for confirmed contacts with members of the Club.

- 1. YU applicants need 15 contacts (QSL).
- 2. EU applicants need 8 contacts (QSL).
- 3. All other applicants need 4 contacts (QSL).

WYUDXCM is available to licensed amateurs and shortwave listeners. Only contacts after 1st January 1970 are valid.

Please send your application (with details from YU QSL cards), confirmed by two other amateurs and 7 IRCS or US\$1 to —

YUDXC,  
P O Box 82, 82253 PTUJ,  
Yugoslavia.

Members of YUDXC (until 1st January 1977):

|            |            |
|------------|------------|
| 1. YU2DX   | 21. YU2HDE |
| 2. YU1B0C  | 22. YU3D-K |
| 3. YU3EY   | 23. YU2BOP |
| 4. YU1SJ   | 24. YU2CAW |
| 5. YU1BCD  | 25. YU3ZV  |
| 6. YU1AG   | 26. YU4EBL |
| 7. YU2HFJ  | 27. YU2QZ  |
| 8. YU1SF   | 28. YU1CDO |
| 8. YU4HA   | 29. YU1ELM |
| 10. YU2AKL | 30. YU3TXT |
| 11. YU2OB  | 31. YU3RBO |
| 12. YU2A   | 32. YU3TDX |
| 13. YU2CM  | 33. YU3VU  |
| 14. YU2CBM | 34. YU1NFO |
| 15. YU1AHJ | 35. YU2EP  |
| 16. YU2RAZ | 36. YU2CDE |
| 17. YU2CO  | 37. YU3BU  |
| 18. YU3DD  | 38. YU2TJA |
| 19. YU2OK  | 39. YU3TFB |
| 20. YU2BH  | 40. YU2RTW |

Also contacts with 4N2CI, 4N2SO, 4N2BR, 4N2HV, 4N2KO, 4N2KP, 4N2LO, 4N2MT, 4N2CX and YU8DX are valid for WYUDXCM.

### DIPLOMA "JADRAN"

This award is issued by YU2AKL — Rad o klub "Ante Jonic" — Split — Yugoslavia to licensed amateurs and SWLs for confirmation of QSO's with Yugoslav amateur stations located on coast or islands of Adriatic Sea.

YU applicants need 25 QSLs with 8 places.

EU applicants need 10 QSLs with 5 places.

All other applicants need 5 QSLs with 3 places.

Your application with details of QSOs YU QSL cards and 8 IRCS (or US\$1), please send to —

Radio Klub "Ante Jonic" — YU2AKL,  
P O Box 89  
58001 Split, Yugoslavia.

Only contacts after 1st January 1970 are valid. ■

## LARA

Ladies Amateur Radio Association

This month's item of news comes from the Roaring Reporter who attended the LARA Birthday Weekend in VK3. This event was held at a small place called Cherokees and our hostess for the occasion was Heather Mitchell (call sign VK3N7), YF of Peter JANX. It was a beautiful drive up there and when we arrived there was a blazing log fire to warm us up. Peter drew a set of superb maps to guide us to, and in case anyone got lost there was talk-in on radio.

# WHAT'S BLACK & WHITE AND TURNS 2-METRE OPERATORS GREEN?

## THE NEW KENWOOD TR-7400

This is the one, the Kenwood TR-7400 FM mobile transceiver of 25/10 watts and complete 2 metre band coverage (144-148 MHz). It has the largest digital readout in its class, and the 800 channel

coverage with PLL frequency synthesizer provides you with all existing and proposed Australian repeaters. A convenient front panel switch offsets the transmit frequency up or down 600 kHz

 **KENWOOD**

A few of the members returned home on the Saturday but a few hardy souls stayed the night then joined in the broadcast call-back on the Sunday. As the week-end coincided with the Mid-winter Field Day, this was also a feature of the program. The traditional barbecue was held on the Saturday evening and, as usual "a good time was had by all".

Other Birthday associated activities included a special sked held on Monday, July 25th, on 80 m and a VHF sked held on the Tuesday for Melbourne YL's. These will be reported in the Newsletter by those who took part.

The next edition of the Newsletter will be posted this month, and will include, amongst other things, a voting paper for the LARA emblem, giving members a choice of four possible patterns. Once this is decided, we can print membership cards, newspaper and award certificates possibly in time for the next AGM.

One of our members unable to join the Birthday Party was Heather Bedson. We understand husband Ray VK3ZEB is ill, and we send best wishes for a speedy recovery to him.

In VK3 there will be a September meeting, held on Saturday 10th, at the home of Marilyn Miteas VK3KAO. For other activities of LARA, members can consult the Newsletter or follow the WIA broadcasts locally for news of activities.

## ATV NEWS

KEVIN CALLAGHAN VK3ZVJ  
PETER COSSINS VK3BFG

This month I have some news of activity in the West. Rod VK6RHM, advises me of some activity in Perth. ATU stations over there are VK5PFR, VK5PFD and VK5BRH. The WIA VHFR Group also have a large amount of surplus equipment which includes 2 inch RCA tape machines, Image Orthicon Cameras, VHS mixer and sundry other pieces.

The exciters used for transmissions are all from VHF Communications Co. (DV4L), although Rod is a SWL amateur and plans to build a VK3ZB5B after market. There is still operating on the National Simplex Channel of 4205.5 MHz (see note VK5SI).

Les Jenkins VK2ZSJ has designed a new converter for ATV. The unit is very small and has the feature of high rejection to VHF Amateur Band and commercial TV transmissions.

It is a broad-band device, which when correctly aligned is as tight as one in any part of the 70 cm band (no trouble in receiving inter-carrier sound). Further details may be obtained by contacting Les at his home QTH.

He also to hear from our friend in the South — Winston VK7EM in a letter received recently Winston tells of his proposed experiments on 1296 MHz next summer. Hopefully this will promote activity in VK3 this summer.

## LETTERS TO THE EDITOR

Any opinion expressed under this heading is the individual opinion of the writer and does not necessarily coincide with that of the publishers.

Dear Sir,  
Reference the letter by VK6KK Mr C. Whalley in July AR. I fully concur with all his remarks concerning the DXCC countries list etc. and also his remarks concerning QSL cards.

Whilst not a DX chaser myself, I found the DXCC countries list very useful as one could tick off the prefix of countries contacted, and at a glance could calculate the number of countries in one's log. It also kept me up to date with any new calls which might have arisen during the preceding year. I seems quite ludicrous to me that a magazine produced for the benefit of the radio amateur should discontinue with this very important service. One can only wonder at the thinking behind the decision.

On the subject of QSL's, as an ex G, I find it difficult to understand why as a member of the WIA I should have to pay for each and every QSL

card I send through the bureau, because as an ex RSGB member, I can bear out Mr Whalley's statement, the RSGB QSL bureau is an absolutely free service to members. Due to the present fantastically high price of having cards printed, plus the extra charge placed on each QSL through the bureau, I no longer automatically fill out a QSL card after each contact. I now wait to receive a card from the other station, before sending off my card. I used to QSL 100 per cent. Whilst on the subject of QSL cards, I understand people are printing their own individual designs of cards, and for those of us who consider that a QSL card is just a confirmation of a contact, and having regard to the high cost of having QSLs provided, would it not be a good idea for the WIA to design a standard card, have a go at getting them printed at a cheap rate in view of the many thousands which would be required, even if it means having them printed in another country. A space could be left on the card for the station call and address, to be printed in by the operator, or by rubber stamp.

I feel sure that with a little thought these cards could be arranged and I feel sure there would be a ready market in VK for such cards, and with probably a margin of profit for the WIA — what do other members think of the idea?

### FRANK BIRD, VK2AZE

(The DXCC countries list is in the 1977 Callbook — Ed.)

The Editor,  
Dear Sir,

### ROSS HULL MEMORIAL VMF-UHF CONTEST "16 IT AN EVENT OF THE PAST?"

This once remarkably popular contest was first held during the summer of 1950-51 to perpetuate the memory of the late Ross Hull, who did so much towards work in VMF and UHF field. Since the first contest many Australian amateurs have participated, including trophy winners, in the first, P. V. Galbraith trophy winner, in the first 1950, 4KX, 4KX, 680, 4NQ (dec). 30M, then the consecutive 3 times winner 3ALZ, 4ZAX, 3ARZ, 5ZDR, 4ZAX, 5ZDR, 3ZER, 3ZDM and 5HP. This takes us up to 1956-57 when my records cease, having at that time obtained these trophies thanks to Peter 3ZPA and David 3QV.

As a long-standing competitor in this contest, having seen many ruthless changes in the rules, I consider I am eligible and competent enough to make these comments for your readers' digestion and thought.

My own humble achievements are the winner of 5 first places in the VK2ZM class of contests, 1950-51, 1956-57 and 1960-61 and I am particularly proud of these certificates, because they represent three summers in which there were three entirely different sets of rules, mainly as to the duration of the contest for log submissions.

From 1950-51 until 1956-57 there were no rule changes and logs were required for the first 5 weeks duration of the contest. In 1956-57 the rules decided to allow two submissions to the best 5 days consecutively, besides introducing a 48 hour period and in 1956-57, they brought in a period of 7 days, not necessarily consecutive, while retaining the 48 hour period.

Alas from 1956-57 to 1960-61 points were abolished for contacts under 50 miles, but this was reinstated in 1960-61, as well as a limit on the number of contacts per point awarded for contacts over different mileage ranges over the years, until 1976-77 when the scoring system was changed entirely, with the mileage system being abolished in favor of points per contact being made on a State to State basis. This seemed fair enough, when you consider the people who have to check the logs.

Further in 1975-76 the organisers decided to stop issuing certificates to State winners and restricted certificates to first, second and third places in each section, with even this "penny-pinching" attitude being abolished, apparently, in the last contest 1975-77.

The point of my remarks to date, based on facts, leads to the question "Were all these changes necessary, or were they brought about by "whinges" from disgruntled competitors?"

Besides, they seem to bring disregard for the man, whose name this contest was "supposedly" designed to perpetuate the memory of and I for

one, feel he must turn in his grave at the thought of this state of affairs.

Another quest on may well be asked, "Where do we go from here, will this once highly regarded contest continue to exist, in view of the seemingly lower number of log entries each year?"

A final question, "Could this be one of many possible causes for the membership of the WIA to be only about 50 per cent of all amateurs in Australia?" My answer being "YES".

Finally, let those responsible get together and give the matter careful thought and introduce a set of rules for future contests which will remain unaltered over the years, as well as making it "world-wide" winning or getting a certificate. A suggestion is that you abolish the 7 day and 48 hour periods, take the full 16 days, why not re-instate a rule requiring one for say 14 or 8 days, being the best consecutive? As well as reintroducing the issue of perfects for the highest scorer in each call area, leave the points scoring system as in the last contest, 1975-77, with the bonuses.

While it may seem hard on some operators, remember my previous ramblings and keep it a hard contest to win, as well as being able "to take the good with the bad".

Sincerely yours,  
ALBERT F. BIRCH, VK2ZFB/VK2NB.

The Editor,

Dear Sir,  
I refer to the letter from C. Whalley VK6KK in July AR where he comments on QSL Bureau changes. I would like to correct him as far as the VK2 Division is concerned.

For some time now the Division has had free handling of cards for members. To those who reside in the country areas, the Bureau posts cards at economic rates.

Our Bureau reports that this has created a marked increase in use of the fact files with costs remaining low as a percentage of total membership.

By way of general information on our QSL address is C/- P.O. Tersiba, NBW, 2284. Would all please note that this is the only address and that GPO Box 1734 is no longer an operational address.

T. MILLIS, VK3ZTM (President VK2 Division)

The Editor,  
Dear Sir,

In my letter published in May AR this year on production of Morse practice tests, I stated the RMRD possessed a Morse keyboard I have since discovered that this is not so. The examination in Sydney is prepared using such a keyboard, but it is the personal choice of one of the Radio Inspectors and is used by him in the hope that a degree of uniformity can be obtained so that candidates can know what to expect.

My apologies to those concerned.

Yours faithfully,  
Mark Salmon VK2DI.

The Editor,  
Dear Sir,

The planning of the 432 MHz band is woefully inefficient according to my way of thinking.

My plan is as follows.

420 -425 Ch 1 TV

425 -431.5 Ch 2 TV

432 -432.5 All useable modes

432.5-434.5 FM Simplex repeater in/out beacons

435 -438 Satellite window, Ch 2A TV

438 -443.5 Ch 3 TV

444 -449.5 Ch 4 TV

449.5-450 Experimental.

There are small guard channels between some of the main segments which I have not allocated.

The TV allocations are based on a vestigial sideband standard. If the commercials have a vestigial sideband standard there is no reason why amateurs cannot have the same bandwidth.

Right now there is a QRM problem on ATV in VK3. In order to make things no more difficult than necessary for the ATVs, it is desirable that ATV channels be as close together as possible. The main limitation here is antenna bandwidth.

In order to make up for the low sideband power of ATVs we have to use high antenna gain. There is no way in getting gain of 20 dB or more on

432 over a 20 MHz bandwidth without going to a very large structure e.g. a 20 foot dish.

Ch. 2A TV is a proposed narrow band vestigial sideband suppressed carrier system for satellite (or to and from when not required for satellite).

Yours faithfully,

J. F. Berwick VK3ALZ.

P.S.—I propose that a deadline be set for the conversion of ATV to vestigial sideband — prior to this a decision will have to be made which sideband to suppress.

The Editor,  
Dear Sir,

After reading the letter from the VK3 CW Coordinator, AR, July '77, and going back to the May and February '77 and the October '76 editions of AR where related letters have been published, I was prompted to put in my "two bob's worth".

I, for one, see what Rodney VK3UG is pointing out in the leading comment of his letter in AR Oct. '76 issue co-ordination of Morse code practice sessions, and, primarily as far as I am personally concerned, publication of times, frequencies and call signs of those stations taking part in slow-morse practice sessions.

As the co-ordinator of the VK2 division mentions, he believes there is a service originating from VKA and AR that he knows of a service from VK3. Well, as far as I know, there is a service in VK3 on 160m, but where, when, on what specific frequency? We could probably confirm.

I think my point is plain enough; one person thinks one division is producing a slow-morse session, another person does not know anything about it but thinks his division produces a session, on what frequency or time he does not know least of all the station call sign.

How about all bods as that conduct a slow-morse broadcast while to Mr. Champness and let him know all the details of your service so that they may be published in AR. I'm sure Mr. Champness would not mind sparing a few lines for such information which would help the newcomer, and the not-so-new.

"Newcomers' Notebook" is temporarily in recess. We will be happy to publish details of slow-morse transmission not now listed in the AR directory (p3) as and when received. Ed.)

Personally am well aware of the fine efforts of the VK2 and VK5 Divisions, but what about everybody else that conducts similar sessions?

In closing I would like to touch on the topic of Morse standards. The first time I attempted a P and T Morse Examination, I was surprised to hear the Morse being sent the way it was. Being a regular listener to the VK2 and VK6 sessions, the only two I am aware of, I have come to notice the difference between P and T machine Morse and hand-sent Morse at the required speed.

The difference to somebody who has little trouble coping with Morse may well be negligible, but it is of great significance to a person who has difficulty with the code, hence Mr. Champness's suggestion of machine Morse or perhaps more speed at a higher speed and slowed down. Even I can send better quality Morse at 15 wpm than at 5 wpm and I think a lot of people would be of similar opinion.

This letter is not directed at any party or persons, but is intended to shed a little light on what may have been turning into a dark situation.

How about it, State Co-ordinators, I think we will be all better off for it.

Bruce R. Kendall VK3AZM.

# VK/ZL OCEANIA Dx CONTEST RULES

The WIA and NZART, the National Amateur Radio Associations in Australia and New Zealand, invite world wide participation in this year's VK/ZL Oceania DX Contest.

## GENERAL

For amateurs of the world to contact VK, ZL, Oceania stations on all bands, 1.8 through to 26 MHz.

## DATES

PHONE — first week-end in October; CW — second week-end in October. Starts 1000 GMT Saturday, ends 1000 GMT Sunday.

## TYPE OF COMPETITION

- (a) Transmitting Phone — Single Operator.
- (b) Multi Operator outside of VK/ZL.
- (c) Transmitting CW — Single Operator.
- (d) Multi Operator outside of VK/ZL.

## SCORING

To consist of five or six figures, made up of the RST report, plus three figures which commence at 001 and increase by one for each successive contact.

## SCORING

### OCEANIA STATIONS

2 points for each QSO on a specific band with VK/ZL; 1 point for each QSO on a specific band with the rest of the world.

### WORLD STATIONS

2 points for each QSO on a specific band with VK/ZL; 1 point for each QSO on a specific band with Oceania other than VK/ZL.

**FINAL SCORE FOR OCEANIA AND WORLD STATIONS** is derived by multiplying total QSO points by the sum of VK/ZL call areas worked on all bands. (The same VK/ZL call area worked on different bands counts as a separate multiplier.)

### VK/ZL STATIONS

On EACH band, one point per contact, multiplied by the total number of different prefixes worked. Final score to be the sum of the band scores.

### VK/ZL QSO 80 METRES

As well as to overseas countries, contacts on this

band between VK/ZL counts for points. Each call area of VK and ZL to be considered a scoring area.

## RELAY ON THE AIRPORT

As for 80 metres, with the addition that contacts between VK/VK, ZL/ZL count for points.

## LOGS

(a) Must show in this order Date, time in GMT, call sign of station contacted, band, serial or number sent, serial received. Make separate log for each band used.

(b) **SUMMARY SHEET TO SHOW** Call sign, name and address (use block letters please), details of equipment used and for EACH Band QSO points for that band and total of prefixes.

Sign a declaration that all rules and regulations have been observed.

## AWARDS

FOR OVERSEAS STATIONS Attractive coloured certificates will be awarded to EACH country (call area in USA, Japan, USSR) on the following basis:

- (1) Top scorer for the country
- (2) Other certificates will be awarded; 2nd and 3rd and separate band awards, depending on activity for conditions prevailing
- (3) Where there is a high participation from any call area, a WIA plaque will be awarded to top scorer with separate plaques for Phone and CW.

**VK/ZL STATIONS** Certificates will be awarded as follows—

- (1) Top scorer on each band for VK and ZL
- (2) Top scorer in each VK and ZL call area.

**NOTE** There are separate awards for Phone and CW.

**RETURN OF LOGS** posted to reach —  
VK/ZL Manager, WIA, GPO Box N1002,  
Perth 6001, Western Australia.

**H. Penfold VK8NE**, 388 Huntress Road,  
Woodlands 6018, Western Australia,  
before 1st January, following the contest.

# 20 YEARS AGO

Ron Fisher, VK3OM

## SEPTEMBER 1957

Amateur Radio of September 1957 contained one of those rare articles that instantly created a sensation. VK5AX's "All-Band Phase-Locked without Band-Switching" was immediately being reproduced by amateurs and short wave listeners all over Australia. Designed to cover the range from three to thirty megahertz with an "All-Band Tank Circuit" and provides a large amount of RF gain, it was just the thing to pep up the old AR7 or AR8 that was getting a bit over the hill. Two SACT's, one as the RF stage and the second as a cathode follower output, were used. All the bits needed were in every junk box.

Other technical articles for September included "A Two Metre Long Yagi", by Ian Berwick VK3ALZ. It was indeed long, the boom being nearly ten metres.

Ninety Degree RF Phase Shift Networks, by N L Southwell VK2ZF, described quarter-wave coaxial networks and delay line type networks. Part five of "Modifying the AR7 Receiver", by Gordon Bowes VK5U, showed how to obtain full 20 metre bandspread with the Band E coil box. The Editorial page urged a greater use of reference books in Amateur Radio research. They suggested the use of Divisional and Public Library facilities. With the rapid expansion of Municipal Libraries over the last few years, these services are available to us all. However, I have noticed that in general, books on amateur radio are not well selected. Have a word to your local Librarian, they are always pleased to receive suggestions.

What did the Hamads have to offer in September 1957? How about an Eddystone 640 receiver at \$54, or a modified 522 transister tier at \$36. Perhaps an univised power supply with 800 volt filament transformer plus chokes at \$50 might be more to your taste.

# QSP

## 1977 CALL BOOK

The small note about the new call book on page 6 of August AR was written very early in July whilst details were being finalised. This is the first call book produced in the new series and the number of pages for the call sign listings was underestimated by about 20 per cent. The result is that the weight of the call book, containing more pages than originally estimated, will bring it into the 60 cent postage bracket but the cover price remains unchanged at \$2.85. Copies should have become available late in August.

# YOU'VE CONVINCED US!

We've realised the error of our ways... now the high performance Yaesu FRG-7 is back in all our stores (and many of our dealers!)

*ok - I give up!*

## INTRODUCING NEW LINEAR AMPLIFIERS!

### HF-3-100L2 Amplifier (new model)

Frequency Range 3-30 MHz

Input Power 10W Norm., 5-20W PEP range

Output Power 100W Norm. + 1/2 dB across band, 200-250W PEP output

Input Impedance 50 ohm norm., adjustable to match exciter range under 2.1 across band

Output Impedance 50 ohm norm. up to 3.1 VSWR acceptable with little degradation

Current Draw 1.6 A norm. 1.8 A supply recommended at 13.6V DC

Power Supply 13.6V DC recommended for best results, 11-14V DC acceptable positive or negative ground

Pre-amp 16 dB norm gain across entire HF band, 15 dB typ. at 50 MHz, 3-4 dB NF

Size 19 1/2 x 18.5 x 8.9 cm. Weight 1 1/2 kg

### 80W, 144-148 MHz, FM, SSB LINEAR AMPLIFIER 2M10-80L

### 2M10-80L Amplifier

All solid state microstrip design

Broadband requires no tuning across band

Variable T-R delay for SSB/CW operation

Ful VSWR & reverse voltage protection

Under 1 dB insertion loss in receive or bypass mode.

Harmonics levels typically -40 dB or better

Measures only 7 1/2 x 10 2x16.5cm, wt. 1kg

A letter has been received from Graham VK8JCZ in Darwin which, among other things, summarizes our few inaccuracies in the beacon list. It appears HK8WI is no longer operational, and serious doubt exists about the Japanese beacon which he thought had moved to 52.500 but was very doubtful. It was on the air. Both of these stations have been removed from the beacon list for the time being. It appears also to confirm no Hong Kong TV exists on 51.750, but the TV station on 49.750 is a very good pointer to openings to the north and might well be shown as a beacon?

Graham goes on to say things have been relatively quiet in Darwin throughout June and July, although on 24/6 he worked JA8RJK, JA8RUR and JR8PQ around 58 at approximately 1350Z. On 27/6 and 28/6 he worked JYL1V6BE in Hong Kong around 6500Z, peaking to 56 with slow QSO with deep fades. LY1LL was on 50 1 and Graham on 52.1 MHz. LY1LL is now using a TS500A instead of the FTV500 due to the former being capable of FM. Subsequent interest has been aroused in Hong Kong over TEP to Australia that LY1LL has written to the local P & T people for an amateur allocation from 52000 to 52.300!

Brian VK5BV has sighted the VL5AA beacon operating on 49.750 MHz which is run by WRE, a temporary location at H.M.A.S. Coonawarra near Darwin, running 100 watts to a four element yagi pointing north. Thanks for the letter, Graham.

George Francis, that doyen of FM operation, has written from a new location, C/- Elecom Training College, P.O. Box 1165, Boroko, Papua New Guinea, with some news of happenings on that big island to our north. He advises already showing an interest by joining the PNG Amateur Radio Society and being elected on the publications Committee. The only novice so far there is Ron P29NRP, who operates 5600 kHz nightily and week-end. George has been included in the VHF Sub-Committee which is co-ordinating and planning a 2 metre repeater for the Port Moresby area.

The 2 metre FM channel mainly used throughout PNG at the moment is Channel 40, and is a 24 hour net. George monitors Channel 50 and 52.650, and sometimes 144.100 SSB. The only high band opening since his arrival was on 26/3 when for two hours he watched Channel 7 TV from Townsville, 800 miles away, and good enough for colour

on peaks, but no sign of the Townsville 2 metre repeater located on the same mountain.

George is located on the northern side of a mountain peak which effectively blocks his view of Australia, hence he does not see on the Channel 9 and 10 reception from Cairns received by those living on the southern slopes of the same mountain. However, he does have good views to the north-east, including north around to south-east, which will possibly have some compensations at these progressions.

His six metre activity started with a contact on 27/3 with Gary P29GR, who has now returned to Brisbane as VK4AR. The other local six metres operators are Ken P29ZDU, Hugh P29BH and Les P29LS. Graham P29DJ is still active from the gulf on a timber mill on the Erg River near Berens, Thoro with 6 metre gear include Tom P29KE Rebeau, P29GA at Lee, P29CM (ex VK2CH) Randal, and possibly others. George's first real DX was on 16/4 when he worked Ross VK4HO, Hal VK4D, Lynn VK4ALM and Mario VK4MS, plus hearing Channel 0 from Brisbane.

Graham P29DJ, along the gulf, reported 14/4 hearing strong JA's around 51 MHz but nothing on 52 MHz. George finally worked his first JA's on 23/4 with 5W signals for 89-1, being VTAUW/KD, both in Tokyo. Literally "thunderous" of openings were made on 52 MHz, 50 to 52 MHz but only two above! His general observations so far indicate they have an equinoctial DX season period lies to north and mid Queensland, as he worked from Cairns down to Bundaberg on April 18, 17, 24, 26, 27 and 4/5. Nothing for the rest of May, then on 5/6 with Peter VK4ZPR portable west of Bundaberg, and others in Townsville, Ayr, etc. Since then on 4/7 he has only heard Ch. 0 in Brisbane, and makes the observation that possibly the winter minor solstice period Es does not extend to the tropics or Equator, as they heard none of the good openings occurring between VK3-VK3 and VK4 on 27. Thanks, George, for your letter, would be pleased to hear from you again some time.

### HOW READ THIS

If you have not already established the thought after reading the relevant parts of the above two letters, then let me put you right. I have mentioned the fact before, and I now repeat, we are very severely disadvantaged in VK through the loss of the lower 2 MHz of the 50 to 54 MHz band. Many times we could establish contact with other countries but for the large difference in frequency. How many of you who operate on six metres would be prepared to suspend a mode to try another? Operation also in the range of 50 to 52 MHz? There are several answers for thought: (1) Straight-out availability of 50 to 54 MHz, (2) Agreement to allow VK operators to FVO down to 50 MHz to call a station in the range 50 to 52 MHz and ask him to come up into the 52 MHz range; (3) The provision of a segment say between 50.000 and 50.500 MHz for our operation, and (4) Possibly some improvement would be to increase the allocation to allow us to operate down to 51.000 MHz, which is an area used by overseas countries and New Zealand. Each of these arrangements would be on a non-interference basis to existing services. However, that clause is not really any different from the present situation, no operation even on 52 MHz is tolerated if it causes any interference to other services, viz., Channel 0 TV, etc.

If you are sufficiently interested would you please write to me straight away (don't put it off until tomorrow, you may forget) and set out any thoughts you may have on the above four suggestions, and any others you yourself may think of at the time. If we can get enough people to show sufficient interest to write, it may be possible to present a case for non-interference operation. What do you think? Is it worth a try? Just remember, during the past few days prior to preparing these notes we had the use of the 27 MHz band for our own purposes from 26/7 to 27/7 to make it available for the CB service. Perhaps we could look at the above suggestions in the light of some compensation for the loss of that band. It's over to you.

Ron Mould VK6FM, ex VK3AGK, of Derby, the land of the Baob trees, writes with some news of happenings in that area since moving these a while back. He is operational on 144 MHz SSB,

using a 15 element 28 foot boom yagi and looking for skeds. Ron was unable to take his 23 cm equipment with him and this is stored in Melbourne. After a 16 months stint in Derby he still will be going to Perth and hopes to retire there, from where there are plans to build a 20 foot dish for 23 cm.

Ron operates on 3582 kHz each night on the WICEN net, and also on 14106 kHz at 0300Z each weekend, and on every second Tuesday. He supports the suggestions already made re an HF net for VHF operators and would favour 14 MHz.

Like the rest of us, Ron was greatly grieved at the passing of Ron Wilkinson VK3AKC, and "a recognition of the great amount of work Ron did for amateur radio and VHF/UHF. In particular, he suggests something be done to recognize this work, and suggests either re-naming the summer VHF contest to be the Ross Hull Ron Wilkinson Award, or that a trophy be made available each year to the outstanding VHF/UHF team by an Australian amateur operator. To assist in any suggested thought he is prepared to donate \$100 to start such an award. That's a generous offer, Ron, and will be most welcome. In addition, I am sure that you would be prepared to write to me on the suggested band-changes to six metres might like to comment on the above suggestions as a memorial to Ron Wilkinson. Let me know soon, please so it may be passed on to the appropriate people at Faders, level. And would anyone else like to add to the 100 already promised?

### MOONBOUNCE REPORT

From Lyte VK2ALU via "The Propagator". The EME 432 MHz tests for VK2AMW on 25/6 resulted in a contact with W7G5I, with M reports both ways. XE1RY and JA6CZD were called as scheduled but neither was heard. Our echoes were up to 7 dB over no noise.

Half an hour of the test period was lost when I fractured so I was replaced in the bottom bearing of the main drive shaft. These will now be replaced with high tensile bolts.

Arrangements have now been finalized and material received for the construction of the new wave guide feed system.

Evidence was found on 25/6 of break and entry into the mcombeonside site buildings by vandals. Windows were broken and material strewn over floors, cupboards and doors were opened and contents removed. Fortunately the locked equipment cabinets were intact. All items of easily removed equipment are now being taken away between tests and this will lengthen the setting up time prior to the carrying out of tests. (Seems nothing is safe these days 5LP.)

### THE SERG TROPHY

The South East Radio Group at Mt Gambier has held a very successful convention over the June holiday weekend. Once again the weather was kind to the 70 or so amateurs and their families and friends who attended. The SERG trophy was snatched from the VK5's this time by the team of VK3AWY and VK3AMZ, and we congratulate them.

The time of the year is with us as these notes are written during which activity on the bands generally sinks to a rather low ebb, no doubt hastened by the coldness of the weather and the fewer contacts available. I, too, have been on leave and hence not so much on the air but looking around since returning to work indicates I have not missed much.

I will close now and leave a little extra space for someone else, but please write to me on the two matters mentioned in these notes. Closing with the thought for the month "A bore is someone who persists in holding his own views after we have enlightened him with ours."

The Voice in the Hills.

## CONTEST CALENDAR

September

- 13/11 European Phone Contest
- 13/11 A batross SSTV Contest
- 14/16 YLDR "Howdy Days"
- 17/18 Scandinavian CW Contest
- 24/25 Scandinautia Phone Contest

October

- 1/2 VK/LI/OCEANIA PHONE CONTEST
- 8/9 VK/LI/OCEANIA CW CONTEST
- 14/16 Jamboree of the Air
- 15/16 Manitoba QSO Party
- 15/16 RSGB 7 MHz Phone
- 23/30 CO WW DX Phone Contest

November

- PSG 7 MHz CW
- 12/13 European RTTY Contest
- 18/20 WNDXA CW Contest
- 26/27 CO WW DX CW Contest

## SCANDINAVIAN CONTEST—CW SEPTEMBER 17-18, PHONE SEPTEMBER 24-25

Begins 1500 GMT Saturday, ends 1800 GMT Sunday. This is the world working the Scandinavians. In this contest, the same station may work on each band 3.5 to 28 MHz for GSO and multiplier points. Phone and CW are separate contests.

There are three classes for single and multi-operator, single and multi-transmitter. Multi-transmitter stations must use a separate serial number series for each band. Club stations are considered multi-operator.

Exchange R/T/T and GSO number starting at 001. Points for European stations 1 point for each QSO on any band; for non-Europeans, 1 point per contact on 14, 21 and 28 MHz and 3 points if it is on 3.5 or 7 MHz.

Multplier. Each Scandinavian cell area from the following list is worked on each band: (LA1, LB1, LJ1 etc) in some cases as are SM3, SK3, SL3. Portable stations in Denmark or Norway count as the 10th area. OH0 is the 10th area for Finland with OJ0 as a separate area.

Prefixes used in Scandinavia are LA1/LB1/LG1/LJ1, Norway, JV1, SV1, DK1, JK1, JA1, Mayan; OF1/OG1, OH1/OI, Finland, OH0, Alan Is., OH1, Market Reef; OY1, Greenland, OY, Faroe Is.; OZ, Denmark, SJ/SK/SL/SM Sweden.

Final score is the sum of QSO points from all bands times the sum of multipliers from each band. Certificates will be awarded to the highest scoring station in each class, both phone and CW, in each country. See a summary sheet showing scoring, your name, address, license, call letters, and a signed declaration. Send logs to the NRRU Contest Committee, P.O. Box 21, Refslet Oslo 5, Norway, by October 15th.

## CLASSIC RADIO EXCHANGE

Starts 1800 GMT Sunday, September 25th, and ends 0100 GMT Monday, September 26th. The object of this activity is to restore, operate and keep older equipment with like minded amateurs. A Class C Radio is any piece of equipment built since 1945, but at least 10 years old. (An advantage, but not required to enter.) The same station may be worked on each band and mode and with different equipment combinations, but no AM phone below 21 MHz.

Exchange name (RE1), State, province or DX country, receiver and transmitter type (i.e. home brew, 607 final etc) and any other interesting information.

Scoring Add the number of different transmitters and receivers States, provinces and DX countries worked on each band. Multiply by the sum of QSO's made. Multiply that total by the Classic multiplier (Total years old of all transmitters and receivers used. Minimum of 3 QSO's per unit). Multiply years by 2 if it's a transceiver. Frequencies are CW 60 kHz from bottom of each band phone 390, 7280, 14260, 21300, 26500 kHz.

Awards for highest scorers, longest DX, most equipment combinations, oldest equipment, and "unusual achievement".

Send logs with comments, pictures, anecdotes, etc to St. Stephens KSL/N8KAJ, 2388 Queenston Road Cleveland Heights, OH44116.

# IONOSPHERIC PREDICTIONS

**Len Poynier VK3ZGP/NAC**

There are now encouraging signs that the new angle is showing signs of life. June produced an upwards swing in solar activity producing a mean of 38.4. The last week in June produced some of the highest daily counts for some months. However, July did not follow suit and conditions reverted to average for the period.

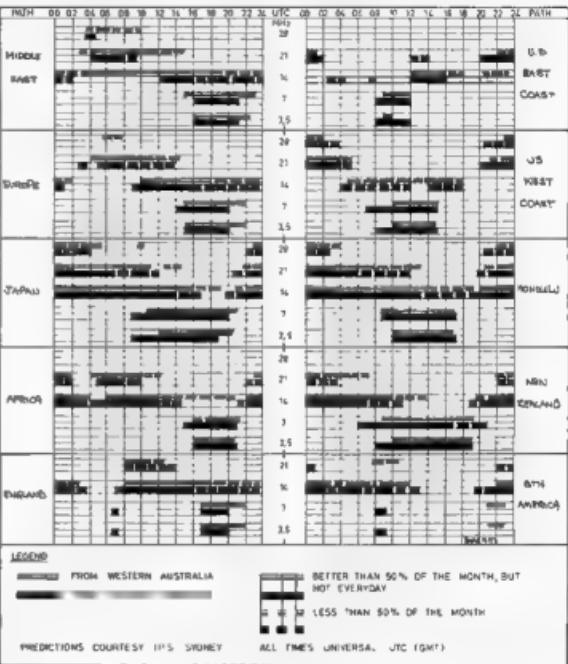

The interesting period now appears to be the September December season when path openings should attain a high degree of reliability and regularity. Looking at the September charts there is ample evidence of some forthcoming 28 MHz openings other than North-South. When conditions are better than those that these charts are based

on there is ample scope for exploration on 28 MHz. In spite of only a poorly ionised region in existence, the influx of Novices will nevertheless have an impact on this band. Certainly the Novices will be able to enjoy some real DX on their new allocation of 28.1 21.6 MHz. Many already have succeeded in working both JA and W stations.

Once again listen to WWV at 18 minutes past each hour for the solar indices. Solar flux figures in excess of 100 and A index lower than 12 and a quiet geomagnetic field should indicate above average conditions. The chart looks good for 75-85 per cent of the month for the solid bars/lines.

Forward predictions for the running smoothed numbers are Sept 24, Oct 26, Nov 28 Dec 30, with the running smoothed number for Dec '76 being 14.7.

Good DX 73's de VK3NAC.

# INTRUDER WATCH

All Chandler, VK3LC

Some members have indicated that they do not feel inclined to submit regular reports unless we tell them what successes have been achieved recently. Success in this game is very hard to define, and will harder to come by. All that can be done by our administration, or any other administration for that matter, is issue complaints (a sample of which was propagated in my column last month) to the countries concerned. International co-operation is the only answer. If countries, and I am not referring particularly to Western countries, will not take notice and act upon complaints, nothing else can be done, and such a case can be seen by the fact that the Russian Pulse transmission still persists although having been often complained about by many countries.

A momentary success was achieved by our Telecon representative who went to the Broadcasters' Conference and, by representation "off-the-cuff" to the Indonesian representative, managed to get a respite from the 7070 kHz Republic of Indonesia broadcast. However, I believe that station is now back on the air again.

Our Region 1 Co-ordinator is doing work of importance. He is taking out a computerised summary of all complaints, world-wide, submitted from 1969 until the present time, for consumption at WARC 70. This, I can tell you, will be an enormous document, and should carry great weight at the Conference.

While in England I will be staying at the OTH of Colin G3PSM, the Region 1 Co-ordinator, and I shall be viewing this summary. I hope to report fully on my return.

# PROJECT AUSTRALIS

Bob Arnold

VK3ZBB

Persistent rumours would indicate that a Russian OSCAR is in orbit and will be opened for communication on October 4 — the 20th Anniversary of the launching of Sputnik 1. No details of orbital path or frequency of operation are known. If information comes to hand, it will be relayed to Federal Office for Inclusion in Divisional broadcasts.

Are you preparing for future satellite activity?

The first AMSAT Phase 3 spacecraft is scheduled for operation in 1979. Its elliptical orbit will provide contacts for hours at a time with countries never before reached from Australia by VHF — and with no skip zones!

Oscar 6 is showing real signs of old age, having completed over 22,000 orbits which is well over four times its design life.

Oscar 7 is nearing its design life span of three years and it is therefore considered prudent to build a further low-orbit satellite which will be known as Oscar D until its launch later this year.

Oscar D and the first of the Phase 3 spacecraft will each carry transponders for Mode A (145.9/29.5) and for the new Mode J (140.8 Up/435.15 Down). Phase 3 spacecraft will be accessible with full quieting SSB or CW signals by any amateur station using an output power of 50 mW and small rooftop style antenna. In fact, it is estimated that the performance of this equipment will be superior to kilowatt-class commercial stations on the HF bands. Furthermore, tracking of Phase 3 satellite will require less equipment and QSOs will be open for much longer times than with Oscar 6 and 7.

Unfortunately, none of these revolutionary facilities can be provided without cost and we need the assistance of all who have used Oscars 6 and 7, or those who wish to be at the fore in this new era of amateur radio.

How can you help?

There are several ways:

— Become a member of AMSAT, the world-wide organisation of radio amateurs and national bodies (including WIA) formed to co-ordinate amateur satellite activities.

— Membership of AMSAT is only \$1510 per year — a donation of \$100 will make you a life member.

— For this you receive the quarterly AMSAT Newsletter and Information on future spacecraft, operating news etc. (It also saves a hassle if your editor or I forget to include the monthly tracking data).

— Persuade your Radio Club to become a member of AMSAT (SUS12 p.a.)

— Or you can specifically help the Phase 3 programme by sponsoring part of the satellite: solar cells \$6 each, battery cells \$120 each, transponders \$3000, rocket motor \$5000 etc.

Your help will be appreciated — if you require further information write to Dave Hull VK3ZBB or myself, or route a note through your Division. New stations heard on Oscar 7 include:

— Mode A FK5BB.

— Mode B VK4ZHQ, ZL4BM, ZL4PG

Finally information from Charlie VK3ACR indicates that the QUAGI Antennae described in QST April 77 are first-class for satellite work as well as for terrestrial contacts.

### ORBITAL DATA — SEPTEMBER 1977

| 29       |               | 13134   | B 0148 82 |
| 30       |               | 13148   | A 0048 66 |

As it is unlikely Oscar 8 will be on for any length of time, only weekly predictions are given.

To extrapolate Orbit Period is 114.896 min. Longitudinal increment is 28.7° per orbit.

# HAMADS

- Eight lines free to all WIA members. \$9 per 3 cm for non-members.
- Copy in typescript please or in block letters to P.O. Box 150, Toorak, Vic. 3142
- Commercial advertising is exc used.
- GTR means address correct in 1975 edition of Call Book (might also be correct in 1977 edition). Next month onwards means correct in 1977 Call Book.

### FOR SALE

Yessi FRG7 comm. Rx, exc., cond., 3 months old, manuals, etc. \$300. Also Hallcrest SX100, Rx, good cond., \$200 or nearest offer Ph. (053) 31 1136.  
Robot Slow Scan TV mode 70 monitor, etc., \$225. Unique antenna tuner (USA) \$75. VK1BHZ, QTHR. Ph. (062) 88 6002 or (062) 65 9347 bus.

**Collins KWM2 transceiver, perfect order, complete with power supply, \$1500. VK7AZ, QTHR Ph. (02) 44 1185.**

**Kyokuto Synthesised 2m Transceiver, 12W, as new, plus 5/8 wave magnetic antenna, fully regulated power supply and full Ringo base antenna, \$300 the lot. Eric Bierre VK2BEK, Ph. (02) 476 5096 evenings.**

**AWA MFR20B on S2 SSB 550 MHz, FM transistor PSU, \$146 linear 25W, compact dashboard control unit with S meter, etc and log cable, absolutely P/C, any test, \$60. Lafayette HA6000 commercial Rx, 80, 40, 20, 15, 10 and 6m, as new, in carton, cost \$205. well \$85. Power supply, NIDAC, 10V-15V at 1 amp, pre-regulated \$72. and 3N3055, \$16. 4x D1646s, untested, \$6 each. 2m crystal relays, DC/DC contacts, \$2 each. VK4ZTM, 32 Railways Road, Shailer Park, Qld. 4126. Ph. (02) 209 8105.**

**Transceiver Fye No. 63 Model 2, 5W AM or CW, VFO or plug in x11 operation 1.8 to 10.0 MHz, none 12V, includes mobile DC/DC converter built-in, also bell-m, serial tuning, until comprehensive metering circuitry and service info included, works well. \$80.00. VK2HJS, 23 Brisbane St., Bondi Junction 2022. Ph. (02) 387 2462.**

**Brake TR4C Transceiver with AC4 240 P/S (both as the current model), 10-80m, SSB, AM, CW, 300W PEP input, with handbook, also complete set of new tubes and transistors, 16 mlt (spares), no microphone. VK2ZWG (full call arriving soon). Going solid state. \$450.00. Ph. (069) 42 1362.**

**FT220 2m Transceiver, very little use, just 3 years new condition, AC and DC powered, FM, CW and SSB modes, reason for sale unable to find time to use it. \$400.00. VK3ATR, QTHR Ph. (03) 536 1064.**

**Euclid record cutting lathe, incomplete, with recording amplifier but no cutting head, some parts damaged or missing. \$180.00. VK2AUI, QTHR**

**One Philips type SVC/1000, manufactured for US Navy, freq. 50 MHz to 21 MHz continuous. All units plug in front, ideal for RTTY or to use. \$13 Final with its Z match as linear ceramic insulation and high Q circuits; very stable VFO; auto X-tuner, 80 to 8200 AC \$220. Also over 200 tubes. VK5LIC, QTHR. Ph. (08) 71 6841.**

**IC202 with a 1x6, new in carton \$195. Full kit of parts for solid state linear 80W PEP for above \$80. Complete RTTY terminal TTL-2 as per ARRL handbook \$100. Crest 7B teleprinter, teletype Tx distributor, teletype tape-punch and printer, \$100 or will, separa-e. Full kit for parts for solid state RTTY model \$30. 1/4-mound morse keyer \$50 as Peter H. for VK3EBC, QTHR. Ph. (080) 24 6514.**

**Heathkit HB-10B Rx - 80 to 10 m, built-in 100 MHz xtal, cat. AM/SSB, perfect condition, ideal for 80W or as a standby Rx for the shack. \$100.**

**Crest 7B "Teaphone" complete with sound cover in good condition \$45. D Hides LD6142, 32 Thorpe Street Morley, W.A., 6002 Ph. (092) 75 2698.**

**BSTV fast/slow d/gital converter, WB MXV design, 1/4, 1/2, quarter frame, video invert, grey scale \$200.00. VK3SHZ Ph. (060) 71 6211**

**X'ts for TR7300 Kenwood Tx/Rx, transmitting 144.46, 144.56, 144.60, 144.72 140.90, 145.15, 145.42; receiving 144.25, -48, -56, -80, -72, -50, 145.00, -15, -32, -75, -80, -85. Best offer or swap 10-80 m vertical antenna. C T. Somerville, Ph. (03) 718 4634 after 6 p.m.**

**FT200, minic cord, complete with manual, \$425. VK3EB QTHR Ph. (03) 41 6037 Bus.**

**FT200 with DC and AC power supply. All 10 m xtal. Black matt cabinet with manual \$350. FTV 2000 manual \$100.00. Includes Oscar crystal \$150. Going mobile. VK2ZGH, Mike Adams, Ph. 205. Ceduna between 8 a.m. and 4 p.m.**

**2 El-20 in Monoband Beam \$37.50. VK3PR, 8 View Court Leongatha, 3953 Ph. (056) 62 2711**

**Philips cathode ray oscilloscope model GM5653 and a circos c switch GM4582/CD \$25 pair. Philips 1676 II m AM complete \$30. VK3MOS, QTHR Ph. (03) 386 4406**

**HG Gain control antenna type 14 AVG, fitted with 80 m base loading coil and relay giving 10-80 m coverage, \$50. VK2AQW, QTHR Ph. (02) 449 3531.**

**Toreld cores for transm. baluns e.c. alnair to p. 581 of 1977 ARRL handbook. Take 'ege' power 3-30 MHz. \$7.55 es. p.s. postage. VK3AGF. Ph. (03) 379 6524. 74 Hillside Pde, Strathmore, 3041.**

**Yates FL50 Transmitter and FR50 Rx, with manuals. Excellent condition, combine as transceiver \$320. VK3BMJ, QTHR. Ph. (03) 879 3209.**

**T222S Digital readout. Must sell as buying a Collins S-line \$390 or near older. VK2XQ, 8 Lade Road, Port Macquarie, 2444. Ph. (065) 83 2175 A.N. (065) 83 2127 Bus.**

**Omega RX4 Rx, T4X3, Tx, TC2 2 m transmit converter, CC1 converter console, power supplies to suit Hygain 215, 15, 15, 2 in Yagi, Geloso 432 MHz converter and Geloso power supply. Home brew transistorized transmitter and power supply 3 to 20 m beam, 160 m linear 400 W. VK5AS, QTHR Ph. (066) 28 2698.**

**IC22A, repeaters 2, 3, 4, 6, 7, 8. Simplex 40, 50, good condition, no mode, mic, manual, original carton, \$175. VK3UJJ, QTHR Ph. (03) 74 5632.**

**8 easy 2 mid. 300W V/F star capacitors, \$120 the lot plus delivery. Set of matched crystals for Kenwood 2 FM single channels 49, 51, 53 and repeater channels 3, 5, 7, 10 all brand new imported, \$10 per pair. VK3ML, QTHR Ph. (03) 20 7780.**

**1G 2 empire F8I Taxer, with chs 37, 40 and repeaters 2 and 5. Provision for 8 channel's. 600 mwell output, supplied with a heated but unused 3 watt amplifier. Circuits supplied, set fitted into professionally made case, \$25. Rodney Chempress VK3UG, 31 Helms Court, Benalla, 3672.**

**Yates FT2B, 2 m FM transceiver with Ch 37, 40, 50, R2, R4, 8W with mic, mobile mount and instruction book, \$110. VK3OM, QTHR Ph. (03) 560 9215.**

**Barlow Medley receiver .5 to 30 MHz, late model, in very good order \$160. VK3OM, QTHR Ph. (03) 560 9215.**

**VHF gear, tubes new QVO3-20A \$10 each, QVO40-60 \$12. QVO7-7 \$3. 2262 \$4. 5783 \$3. EC91, EEC91, EP91, EP85, BAK5, Z77 \$2 each. Edystone split isolator caps type 583 15 x 15 PF or 25 x 25 PF \$4. Power translator for LV regulators 2N1490 or 2N1514 \$5 each. Xlais BTG 7027, 7056 or 7058 \$14 each. 3D200, 3Z200, 34000 MHz each. Field strength meter Eag's type RF-45 model Novice/CB uses \$8. Jostech antenna 1.5 to 30 MHz CW type 5 ATU and reader 320. VK2RJ, 80 Wyong Road, Killarney Vale, 2261. Ph. (043) 32 5758.**

**DX 100 Communications Rx, 140 kHz to 30 MHz, solid state, excellent condition \$155. KW Electronics LP 811, 5 section, 1 kW, as new, \$35. Ringo ARX2, gamma loop matched vertical, 8 dB gain, exceeded 2 m antenna, excellent condition, \$25. VK3HL, QTHR Ph. (03) 32 3412.**

**Kenwood TS 820 plus ext HF oscillator, complete with mobile leads and matching microphone, as new condition, very little use, never used mobile. The two units for less than new price of Tx alone. Sell for \$550, no offers. Contact G. Matheson, VK4WU, QTHR Ph. (07) 375 5282 any time.**

**Yates FT-DX4000 transceiver, 10 m through 80 m, with cooling fan attached, good condition, hand book \$350. VK2AGS, QTHR Ph. (02) 93 4170 A.H.: (02) 438 9281 Bus.**

**AX 100 communications Rx, 15 months old, as new condition \$170. Dx 100 general coverage Rx \$100. Graham VK2ACT/NWPH. Ph. (02) 871 2651 A.H.: (02) 249 7361 Bus.**

**Atlas 215 solid state transceiver, also Atlas AG paper manual, approx 10C's, handbook, Asahi set of centre loaded whips 80-10 m, excellent condition \$685. Mr. Glower VK7MQ, 2/292 Sandy Bay Road, Sandy Bay, Tas., 7005.**

**Two new dual beam CRO tubes, Philips DHM10-83, kept as spare for BW420 CRO, \$50 each, pack int. inc. free. VK2ZKVK, K. J. Cox, 31 Petrie Street, Howling, 2640, N.S.W.**

**Alphas 374 80-11-10 m w/eil con alined deck top bandpass linear power amplifier, no tune up, inc. Elmair 8874 ceramic triodes, 3 kW PEP SSB voice, instant band change or manual tune up, uses three 1.2 kW carrier continuous duty, brand new in factory carton \$2100. James Goodger, VK2JJO, Ph. (02) 36 2981.**

**Brand new Alphas 2100 solid state SSB transceiver with noise blanker, Alphas 240 V deluxe AC console speaker, Alphas deluxe mobile mount, Alphas 10X xtal osc., Shure 404 mic, Maxx axilor helical mobile antennas for 80-40-20 m with mobile base. All equipment brand new in factory sealed cartons, \$1250. James Goodger, VK2JJO, Ph. (02) 36 2981.**

## SILENT KEYS

It is with deep regret that we record the passing of —

**Mr. V. BARNES ex VK3OT**

**Mr. J. I. KELLEHER VK3AJ**

**Mr. D. D. KERR VK3QJ**

**Mr. G. W. REID VK2JHM**

**SID. C. BAKER VK3DK**

**Sadly our good friend Sid. passed away on 14th July, 1977**

**Amateur Radio was Sid's life, and he enjoyed the many QSOs with his Amateur friends to the full.**

**Sid was licensed in 1928 and came on the air with a UV201 and Kellogg modulation. Band usage were 80 Mx and 200 Mx, with amateur meet on Sunday mornings with Picnic and Vocals by local friends.**

**Many of the early radio tests from aircraft were ones of Sid's involvements. He kept up with new developments and applied them to his Amateur pre sets.**

**Sid, we will all miss you.**

**VIBAN**

**Hiels TM135/450-470 Yagis, stainless steel 1/2 wavelength reflectors, fed gain 15.3 dB at 460 MHz FMT/BK ratio 31 dB. VK3WV 1.3:1 type N, termination, weight 21.8 kg, wind load ng at 120 mph lbs.; as new \$185 o.n. VK4M1, QTHR Ph. (07) 44 7044 Bus.**

## WATERFALL

**30.1 Collins Linear, any condition, VK4-N, QTHR. Want to update from Spark to Silicon? Will swap approx. 500 TLT ICs for a Vibroplex keyer (bug) VK3KEM (QTHR as VK2ZCP)**

**FT 401, 660, 670, 107, 200 type transceiver. Please send all particulars to A. J. Smith VK4ZFM, 3 Sabre Rd, Shailer Park, Qld. 4128. Ph. (07) 209 6105.**

**My "Hy-Tower" Mode 18HT, 80 through 10m vertical antenna. VK2BFJ, 80 Wyong Road, Killarney Vale, NSW 2281. Ph. (043) 32 5781 all hours.**

**Mini-Products Hybrid Dual Antenna 6-10-15-20m. Details and price to Ken VK2BA, Box 768, Camerton 2670. Ph. (09) 41 1001.**

**HF Transceiver FW60, FT200 etc. also crystals to suit Vinten MTR13. Ph. (03) 541 5365.**

**Kokusai mechanical filter type MF-455-10K or suitable alternative. Advice cost or a distributor J. Brinkman VK2IS, 61 Gundagai St, Cooma Harbour 2450.**

**HF/WF, AM/FM modulation meter. Please advise price and data to Peter Barrell VK2ZTT, Box 281, Mt. Gambier, S.200.**

**Schematic and xlst data for CPRC85 50 MHz tunable, used formerly by AIF, RAAF. Manufactured by Rogers Magnetic in Canada, circa 1965. Duane VK2VE Ph. (02) 655 2006, QTHR.**

**FT101B, in good cond., complete VK3EB, QTHR. Ph. (03) 41 5037 Bus.**

**PL1006 linear amp/ifier and TM33 Jr. beam VK3A-G Ph. (03) 285 2024**

**Some kind amateur in Perth willing to obtain a Ken SWR (with some knowledge) to obtain his call sign willing to pay R.R. Don 74 1175.**

**To complete 1000 W. Transistor, Hasse No. 50 and 100 stage modulator or circuit. To complete type 2 Ant. 100W. Hasse, any other of spares. C Gracie, Caversham P.D. 3408.**

**430-550 MHz or better gndg' ger probably in working condition in Rep's VK3AH, QTH-R**

**DY21 or DY21A for use with icom IC21A, VK3ARZ, 769 High St Road, Gran Waverley, 3150. Ph. (03) 232 9492**

**Hi or buy JL speaker crystals for Ken KP202 VK3JP, 14 Henley Road, Mt. Pleasant, W.A., 6155. Ph. (09) 54 1779**

**BFO for Tric SR50 and help in installing it by someone in my area. Am also collector 78 rpm records w/ing purchase, good prices. Cut my collection. Please wrt to Barrie Boyce, L30425, Abbott Street, Sandringham, 3191.**

# FT-301D

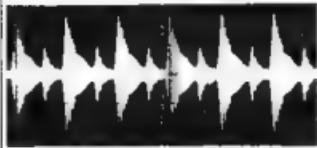

## All Solid State Digital Readout HF Multi-Mode Transceiver

The FT-301D is an advanced fully solid state Digital Readout SSB, AM, FSK and CW transceiver covering 160m thru 10m including one auxiliary band and WWV. It has all the outstanding features of Yaesu's top performance FT-101E (inc. RF Processor) plus many more additions (Digital Readout, IF Rejection filter, & switchable AGC time constant).

### RF PROCESSOR

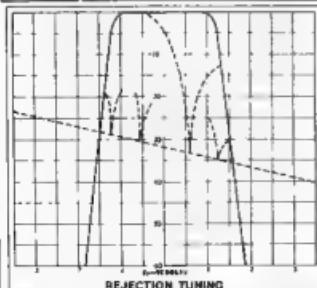

The RF Processor increases talk power .0 dB through the pile-ups without addition of a linear amplifier.

RF Processor "OFF"

RF Processor "ON"

REJECTION TUNING

### FEATURES

- ALL Solid State — 27 IC, 47 TR, 24 FET and 94 diodes
- ALL Modes — 160 through 10 meter plus receive only for WWV/JVY
- ALL Modes — SSB (USB/LSB selectable) CW, AM and FSK
- Digital D/R Readout — by large LED digits
- 200 Watts PEP INPUT for SSB, CW and 50 Watts for AM, FSK
- RF Feedback — for clean signal
- Rejection Tuning — tunable crystal filter rejection
- Effective Noise Blanker — for elimination of noise
- RF Speech Processor — for increased talk power
- Built-in fully adjustable VOX
- Automatic break-in CW operation with selective Selction — 25 kHz or 100 kHz
- 2.5 MHz TX/RX or RX clarifier with separate ON/OFF switch
- Selectable microvolt AGC system — SLOW, MEDIUM and FAST
- Built-in internal crystal control of (11 channels) provision and direct 10 second memory
- Adjustable carrier level for remote up and service generation
- Triple protection circuits for PA stage and memory system
- Built-in SSB filter for unparalleled selectivity
- Built-in speaker
- Compact size, light weight
- Complete line of compatible accessories for flexible

### TECHNICAL DATA

**FREQUENCY RANGE** 1.8—2.0 MHz, 3.5—4.0 MHz, 7.0—7.5 MHz, 10.0—14.5 MHz, 21.0—21.5 MHz, 27.0—27.5 MHz, 28.0—29.9 MHz, WWV 5 MHz (receive only)

**MODES** SSB (USB/LSB), CW, AM, FSK, CW and AM FSK

**FREQUENCY STABILITY** Within 100 Hz during any 30 minute period after warm-up. Not more than 100 Hz with 10% line voltage variation.

### FT-301D Accessories everything you want in a complete home station design.

YAESU's years of experience in the radio amateur field are exemplified in the FT-301D series. The FT-301D can be interconnected to its matching power supply and external VFO unit. This feature provides you with a completely integrated home station with transceive operation on either

VFO split frequency or crystal controlled operation with a flip of the switch. The FT-301D with built-in speaker is a complete AC power supply unit can be used for any of the following power voltages:

100/110/127/200/230/254 Volts, 50/60 Hz. A digital clock and

- AC Power Supply FP-301D
- AC Power Supply FP-301
- External VFO Ft-301
- Monitor Scope YO-301

**TUNABLE REJECTION TUNING** The tunable IF rejection filter utilizes sharp resonance characteristics of a crystal filter. The resonance frequency is tunable over the entire IF range to reject any interferences close to or inside the IF pass-band.

**Calibration Accuracy** 2 kHz maximum after 100 kHz calibration

**Backlash** Not more than 50 Hz

**Antenna Impedance** 50 ohm unbalanced nominal

**Circuity** 24 TET's, 2 Transistors, 27 Integrated Circuits, 100 resistors

**Power Requirements** 13.5 VDC nominal, 1.1 A (digital type) and 0.9 A (idle type) for receive and 2.1 A for transmit

**Size** 280(W) x 125(H) x 270(D) mm/m

**Weight** Approx. 8 kg

### TRANSMITTER

**Input Power** 200 Watts PEP on SSB, 200 Watts on CW at 50% duty cycle and 80 Watts on AM and FSK (slightly lower on CW and FSK in 10 and 12 MHz bands.)

**Microphone** 500 ohm dynamic type

**Carrier Suppression** -40 dB

**Sideband Suppression** -50 dB

**Spurious Radiation** -50 dB

**Distortion Products** -31 dB

**Frequency Response** 300 to 2700 Hz ± 3 dB.

**Final Transistor** S2635 x 2

### RECEIVER

**Sensitivity** 0.25 uV for 10 dB Noise plus Signal, 10 Noise Ratio on 14 MHz

**Selectivity** 2.4 kHz nominal bandwidth at 6 dB down, 4.0 kHz at 10 dB down on SSB, CW and AM 500 Hz nominal bandwidth at 6 dB down on CW and AM 500 Hz at 10 dB down with optional CW filter. 6 kHz nominal bandwidth at 6 dB down, 12 kHz at 10 dB down with optional AM filter.

**Harmonic & Other Spurious Response** Image Reject 1.5 dB below 100 dB Intermod Spurious Signal level is less than 10 dB below receiver noise level.

**Automatic Gain Control** AGC threshold nominal 3 uV Attack time is 5 ms — seconds and release time is a select ed from 3500, 1500 and 200 ms — second on front panel.

**Audio Noise Level** Not less than 40 dB below 1 Watt

**Audio Output** 3 Watts to internal or external speaker at 4 ohm impedance

**Audio Distortion** Less than 10% at 3 Watts output

automatic call sign identifier are an integral part of the power supply. The front display can be selected for either a 24 hour or 12 hour system with a flip of the switch on the front panel. A programmable call identifier can send your call sign in Morse code automatically every ten minutes.

#####

**NOTICE OF MOTION**

Notice of motion is hereby given for the following alteration to the Constitution of the W.I.A. (W.A. Division) to be considered at the October meeting of that Division

That Paragraph 5 on Page 5 of the Constitution be altered to read as follows:

"The Institute shall be governed by a President and Vice-President of the Institute and seven (7) other Councillors, all to be elected from licensed members at the Annual General Meeting as hereinafter provided."

ALSO

That Paragraph 6 on Page 5 of the Constitution be altered to read as follows:

"Nomination of a candidate for election to the Council must be received by the Secretary in writing not less than 42 days before the Annual General meeting of the Institute with an intimation in writing that such candidates are willing to act. A candidate may submit a statement not exceeding 200 words outlining his experience and/or his case for election. Each nomination shall be signed by two members proposing the candidate."

SIGNED BY : VK6DA - VK6NE - VK6AN

## THE FIRST W.A. 4-6 MHZ. S.S.B. TRANSMITTING CONTEST

R U L E S

1. DURATION Saturday September 10th, 1977 and Sunday 11th, September 1977 on both days between the hours of 1900 and 2200 W.A. Time. Six operating hours in all.
2. FREQUENCY All contacts to be made in the 3500 - 3700 Band using S.S.B.
3. CALLING Stations will call CQ WAA using the three times rule technique. Infringement of this rule by the use of long CQ calls may entail disqualification.
4. CONTACTS Points for contacts are as follows with the exception that Stations using 30 Watts P.E.P. or less will get additional multiplier of 2 per contact.

|   |                                   |
|---|-----------------------------------|
| METRO SHIRES TO ALL SHIRES                      | 1 point per contact               |
| INNER COUNTRY SHIRES TO METRO OR                |                                   |
| OTHER INNER SHIRES                              | 1.5 points per contact            |
| OUTER COUNTRY SHIRES TO METRO OR                |                                   |
| OTHER OUTER SHIRES                              | 2 points per contact              |
| OUTER COUNTRY SHIRES TO INNER<br>COUNTRY SHIRES | 2 points per contact<br>each way. |

Outer country shires are:-

BE CN EP EX HC LV MK PD RB UG WE WP WU  
WW and part BD DS MZ

Please refer to Map and Shire Codes provided for the July C.W. Contest.

Inner country shires are rest up to Metro area.

5. SCORING Stations may be worked on each of the two days and these contacts will count for points. Each time contacts will take the form of an exchange of Six character groups comprising EG/SHIRE letters and the last two numbers of your Postcode. e.g. Station in Northam would send 57NM01 or if in Harvey 57HY20.

6. LOGS Contest logs to be neatly set out on one side of quarto of foolscap sheets ruled into 10 columns as shown below

| DATE | W.A. CALL WKD. | RS  | SHIRE | CODE | RS | SHIRE | CODE | POINTS CLAIMED |
|------|----------------|-----|-------|------|----|-------|------|----------------|
|      | TIME           | OUT |       |      | IN |       |      |                |

Column 10 is to be totalled at the foot of each page and the running totals brought forward. The last page should contain the following summary - Total number of contacts and total number of points scored - Input Power - Comments on equipment used, aerials used and comments on the contest in general.

Logs to be addressed to

W.A.A. CONTEST COMMITTEE

P.O. BOX 6250

HAY STREET

EAST PERTH W.A. 6001

and posted so as to reach us not later than October 24th, 1977. The results will be published in the November issue of the Bulletin.

We hear on the grapevine that the C.W. Contest was a lot of fun and raised a lot of interest so lets make this one even better. Its up to YOU to make it a success.

THE 20th. JAMBOREE - ON - THE - AIR

DATE AND TIME : 0001 Local Saturday 15th. October to 2359 Local Sunday 16th. October everywhere in the world, so that early only stations to the east will be on and late only those to the west. These times are a guide only and as this is not a competition you may suit yourself.

TRANSMISSION: Any form of Amateur Transmission is permitted. Scouts and Guides may talk on the air from VK but not from all countries.

OFFICIAL CEREMONY:

Saturday October 15th ,2000 Hrs WAT. 3.6 MHz <sup>+QRM</sup> . VK6SH/P will b/c live with the Scout Chief Commissioner. PLEASE LISTEN and call back on 3.6 MHz. or 2 MHz (Chan40) or 6 MHz. (Chan B ). If another band is also used it will be advised during the b/c. For the callback please advise QTH (Town or suburb) Unit name, Approx. numbers been, present or expected and any special activity.

VK6SH

VK6SH will be Mobile Saturday afternoon and Sunday on 2 MHz. and 40 MHz. (possibly 6 MHz.) to visit as many metropolitan stations as possible. Please monitor 2 MHz. (Chan 40 ) particularly for "talk in". The Station will be portable at other times.

FREQUENCIES

Official Scout Calling frequencies

PHONE: 7090 - 14290 - 21360 - 28990 KHz.

C.W. : 3590 - 7030 - 14070 - 21140 - 28190 KHz.

3.59 MHz. has been used locally on phone without much necessity. Note that VHF is very popular in the metropolitan area, particularly 2 MHz (Chan 40 ) and 6 MHz (Chan B ) would be if more stations were available. Please try 6 MHz even if only to relieve the 2 MHz channel. DO NOT ALLOW SCOUTS & GUIDES TO USE THE REPEATERS - overworked simplex channels are sufficient for one weekend. PLEASE INSIST ON CORRECT PROCEDURE - CALLSIGNS PER OVER and 5 MINUTE PAUSE AFTER A CQ.

WORLD BUREAU

The World Bureau this year will be FØAA from Ferney-Voltaire just across the border from Geneva

BREAK IN

European Stations have been disappointed to hear VKs at time and being unable to break in. Please leave a small gap.

INTERPRETATION

Bulletins to Scouts?Guides have included Q Code translation and phonetics. SL

QSL

QSL is usual. Special cards are available from the Scout Shop Your own are very acceptable if you wish.

LOGS

Your own must be kept, of course. A Scout or Guide may assist with this. They must also keep a Group Log for submission to H.Q. and may need some help. Their log need not be re written to look pretty, but submitted (warts and all) - speed is the important factor. Some may have personal Log Sheets for a special individual award. Please note that Scout/Guide logs are not your responsibility, but assistance and signature would be appreciated.

Any queries gratefully answered  
de Peter - VK6HU

## THE FIRST W.A. ANNUAL VHF/UHF TRANSMITTING CONTEST

## 1. DURATION

SATURDAY OCTOBER 1st. 1977 and SUNDAY OCTOBER 2nd 1977 on both days between the hours of 1900 and 2200 hours W.A. Time. Six operating hours in all.

## 2. FREQUENCIES

All contacts to be made on the 52/144/432/1296 MHz bands using any of the following modes:-

C.W. - S.S.B. - AM - FM - RTTY - TV one contact per mode per evening allowed, but no cross mode or cross band QSO's or mobile contacts allowed.

## 3. CALLING

Stations will call CQ WAA using the three times rule technique. Infringement of the rule by using long CQ calls may entail disqualification.

## 4. CONTACTS

Points for contacts are as follows with the exception that stations using the following modes will get the additional multipliers shown:-

|            |                          |                    |
|------------|--------------------------|--------------------|
| (a) C.W.   | will get a multiplier of | - 3 )              |
| (b) S.S.B. | " " "                    | " - 2 )            |
| (c) AM     | " " "                    | " - 4 )            |
| (d) FM     | " " "                    | " - 1.5 ) MODE     |
| (e) RTTY   | " " "                    | " - 3 ) MULTIPLIER |
| (f) TV     | " " "                    | " - 3 )            |

(g) FM contacts via a repeater - 1.5 ) ADDITIONAL MULTIPLIER

## 5. POINTS PER CONTACT

52/144/432 MHZ. For the transmitting stations up to 250 ft. above sea level and to a 20 Km radius 5 points

For stations 250 ft. to 1000 ft. ASL and to a 40 Km radius

3 points

For each Kilometre over the radius 1 point  
For each Km, kilometre from Tx. 5 points

Above scoring applies to all W.A. Shires.

An additional multiplier shall be applied for the inner and outer country shire-areas as follows:-

|   |                 |                    |
|---|-----------------|--------------------|
| INNER COUNTRY TO METRO                      | a multiplier of | - 2 )              |
| METRO TO INNER COUNTRY                      | " " "           | - 1 )              |
| OUTER COUNTRY TO INNER COUNTRY ( each way ) | - 8 )           | ADDITIONAL         |
| OUTER COUNTRY TO METRO                      | " " "           | - 10 ) MULTIPLIERS |
| METRO TO OUTER COUNTRY                      | " " "           | - 4 )              |
| OUTER COUNTRY TO OUTER COUNTRY              | " " "           | - 5 )              |

## 6. SCORING

Stations may be worked once on each of the two days and these contacts will count for points. Each time the contacts will take the form of an exchange of RST followed by Shire letters and last two numbers of your Postcode e.g. Station in Bassendean wpuld send 599BA54 or if in Armadale 599AK12

7. LOGS Contest logs to be set out on one side of quarto of foolscap paper ruled as shown below and posted to WAA CONTEST COMMITTEE, P.O. BOX 6250 HAY ST. EAST PERTH W.A. before 1st November 1977
